

**Fire Coral**

*Millepora alcicornis*

- Hydrocoral, not stony coral
- Has stinging polyps
- Is encrusting

**Palythoa**

*Palythoa caribaeorum*

- Zoanthid, not stony coral
- Similar to anemones
- Is encrusting

**Gorgonians**

- Octocoral, not stony coral
- Also known as soft corals
- Includes many different types (sea fans, rods, plumes, whips, and encrusting)

*We're All Connected ~ Keep It Protected*

Photo: MML

*Mycetophyllia ferox*

**Common Name:**  
Knobby Cactus Coral  
**Coral Type:**  
Fleshy  
**Bleaching Severity:**  
No Bleaching

Photo: MML

*Eusmilia fastigiana*

**Common Name:**  
Flower Coral  
**Coral Type:**  
Flower / Cup  
**Bleaching Severity:**  
No Bleaching

Photo: MML

*Acropora cervicornis*

**Common Name:**  
Staghorn Coral  
**Coral Type:**  
Branching  
**Bleaching Severity:**  
No Bleaching

Photo: MML

*Undaria agaricites*

**Common Name:**  
Lettuce Coral  
**Coral Type:**  
Leaf / Plate / Sheet  
**Bleaching Severity:**  
No Bleaching

Photo: DEP CRCP

**Black Band Disease**

- Forms a dark ring
- Typically starts at a point on the coral and progresses outward.
- Found on many species.

Photo: Eyes of the Reef

**Growth Anomaly**

- Protruding growth with a distinct margin
- Often a different color from the rest of the colony

Photo: MML

**Predation (Fish Bites)**

- Usually found in pairs from beak marks of parrotfish.
- Found on all species.
- Other organisms that feed on coral: damselfish, worms and snails

Photo: MDC  
Photo: Sara Thinner, MI

**Tissue Loss  
(White)**

- Tissue sloughs off as disease progresses over colony
- In photo: characterized by a multiple, circular + irregular lesions
- Found on many species

Photo: MML

**Tissue Loss  
(White)**

- Tissue sloughs off as disease progresses across colony
- In photo: characterized by a single, linear lesion

Photo: Nikole Ordway

**Tissue Loss  
(White)**

- Tissue sloughs off as disease progresses over colony
- In photo: characterized by multiple, irregular lesions

**Common Name:**  
Great star coral  
**Coral Type:**  
Mound / Boulder  
**Bleaching Severity:**  
Paling

Photo: DEP CRCP

*Montastraea cavernosa*

**Common Name:**  
Mountainous star coral  
**Coral Type:**  
Mound / Boulder  
**Bleaching Severity:**  
Paling

Photo: Marie Dugan

*Orbicella faveolata*

**Common Name:**  
Boulder Brain Coral  
**Coral Type:**  
Brain  
**Bleaching Severity:**  
Paling/Partial Bleaching

Photo: Brian Clark

*Meandrina meandrites*

**Common Name:**  
Lettuce Coral  
**Coral Type:**  
Leaf / Plate / Sheet  
**Bleaching Severity:**  
Partial Bleaching

Photo: Nikole Ordway

*Undaria agaricites*

BLEACHED

*Porites porites*

**Common Name:**  
Finger Coral  
**Coral Type:**  
Branching  
**Bleaching Severity:**  
Bleached

*Orbicella faveolata*

**Common Name:**  
Mountainous Star Coral  
**Coral Type:**  
Mound and Boulder  
**Bleaching Severity:**  
Bleached

*Colpophyllia natans*

**Common Name:**  
Boulder Brain Coral  
**Coral Type:**  
Brain  
**Bleaching Severity:**  
Bleached

TIME AND STRESS

Photo 1. A healthy coral colony with a brown tint provided by the zooxanthellae.

Photo 2. The entire colony has expelled its zooxanthellae causing a "bleached" white appearance.

Photo 3. The colony was unable to regain its zooxanthellae. Mortality and algae growth have occurred.

PROGRESSION OF CORAL BLEACHING

The above photos illustrate a timeline of bleaching for Elkhorn coral, *Acropora palmata*.
