1.0 INTRODUCTION

Golder Associates USA Inc. (Golder) has prepared this Site Assessment Report for the Florida Department of Environmental Protection (FDEP) Site Investigation Section (SIS) to document the site assessment activities and evaluate potential sources of per- and polyfluoroalkyl substances (PFAS) impacting soil and groundwater at the Fire Academy of the South – Florida State College at Jacksonville (FSCJ) site (FDEP Facility ID: ERIC_17235). Golder completed the site assessment activities in general accordance with the Site Assessment Work Plan, dated September 2021, and subsequent e-mail and telephone correspondence. This work was conducted under FDEP contract number HW561, task assignment number SA149. Services were performed in accordance with the FDEP-approved task assignment and Chapter 62-780 of the Florida Administrative Code (FAC).

2.0 BACKGROUND INFORMATION

2.1 Site Location and Description

The site is located at 2700 Fire Fighter Memorial Drive in Jacksonville, Duval County, Florida, in Section 29, Township 2 South, and Range 28 East, within the area mapped by the U.S. Geological Survey (USGS) Arlington, Florida, 7.5-minute topographic quadrangle map (Figure 1). The site is located at 30 degrees, 17 minutes, 55 seconds north latitude and 81 degrees, 30 minutes, 36 seconds west longitude.

The site is approximately 136 acres in area and is part of the FSCJ South Campus. The site consists of multiple firefighter training areas, an emergency vehicle driver training area and skid pad, multiple instructional/office buildings, undeveloped wooded areas and wetlands, and a JEA water treatment facility. The firefighter training areas include instructional space, burn pits, burn buildings, gas props, a debris field training area, an aircraft rescue and firefighting simulator, a maritime fire trainer, and storage buildings. Stormwater features include various drainage ditches and three ponds totaling approximately 2.3 acres.

According to the Duval County Property Appraiser website, the site is owned by FSCJ and is identified as “Public College” land use. The site was first developed in 1974 and firefighter training activities have taken place on the site since at least the early 1990s.

The site is accessed via Alden Road to the north. The site is surrounded primarily by residential and commercial properties to the north, residential and municipal park properties to the east, a utility easement followed by public college property to the south, and residential and county schoolboard properties to the west. The site vicinity map is shown on Figure 2. A site map identifying pertinent site features is shown on Figure 3.

2.2 Environmental Setting

2.2.1 Physiography and Topography

The entire east coast of Florida is located within the Atlantic Coastal Plain regional physiographic province. The Atlantic Coastal Plain in Florida is characterized by five distinct topographic divisions. Duval County, located in northeastern Florida, occurs within two of the five topographic divisions. The western portion of Duval County is located in the Central Highlands topographic division. The eastern portion of the county is located in the Coastal Lowlands topographic division, an area of low relief with a series of coastal terraces and scarps.

The site is located within the Coastal Lowlands topographic division, approximately 7 miles west of the Atlantic Ocean. This area is characterized by ancient marine terraces with a series of coastal beach ridges separated by lower-lying swale features. Both the beach ridges and intervening swale features are oriented roughly parallel to the existing Atlantic shoreline, and represent coastal depositional features associated with higher stands of sea level during the geologic past.

The ground surface elevation in the area of the site is approximately 40 feet above mean sea level. The developed portion of the site is located on roughly north-south oriented ridge that slopes to lower-lying areas to the east and west.

2.2.2 Regional Hydrogeology

Four distinct hydrogeologic units can be defined within the stratigraphic units underlying the property, including the surficial aquifer, the secondary artesian aquifer, the upper confining unit, and the Floridan aquifer. The surficial aquifer consists of the Holocene and Pleistocene sediments, as well as the more permeable units of the

undifferentiated Pliocene and Upper Miocene deposits. This unit consists predominantly of sand, extending to a depth of approximately 50 to 70 feet below ground surface (bgs).

The secondary artesian aquifer consists of sand and shell beds and thin, fossiliferous limestone units that occur in the lowermost Pliocene and Upper Miocene deposits. This unit is typically encountered at depths of 80 to 100 feet in the general vicinity of the site and is typically separated from the overlying surficial aquifer by a relatively thin, reduced-permeability sandy clay unit.

Low permeability marl, clay, and dolomitic beds in the undifferentiated Upper Miocene deposits and the Miocene Hawthorn Group serve as the upper confining unit, which is approximately 450 feet thick in the vicinity of the property. This confining unit restricts the vertical movement of water between the overlying surficial and secondary artesian aquifers and the underlying Floridan aquifer.

The Floridan Aquifer in the vicinity of the property consists of the Ocala Group, Avon Park Limestone, and Lake City Limestone of Eocene age, as well as permeable beds of the lower Hawthorn Group that are in hydrologic contact with the rest of the aquifer. This hydrogeologic unit is the major source of water for irrigation, public supply, and industry in northeast Florida. The depth to the Floridan aquifer in the vicinity of the property is approximately 550 feet. JEA's Oakridge supply well group is located in the vicinity of the site and consists of multiple municipal supply wells screened in the Floridan aquifer.

Recharge to the surficial aquifer is principally through rainfall. The secondary artesian aquifer is primarily recharged by infiltration from the overlying surficial aquifer. The Floridan aquifer is recharged in areas where the overlying confining unit is either thin or absent, which occurs in several counties west of Duval County.

2.3 Site History

2.3.1 Operational History

This site is currently occupied by FSCJ, which has operated on the property since approximately 1974. The Fire Academy of the South began operations in its current location in the early 1990s. Prior to the current use, the site was undeveloped, vegetated land from at least 1943 until approximately 1970 when development on the site first began in the form of a water treatment plant in the southwest corner of the parcel.

According to documents reviewed, hands-on fire training associated with FSCJ Fire Science program took place at a facility on Stockton Street near downtown Jacksonville prior to the construction of the facility on the FSCJ campus in the early 1990s. The present-day skid pad has existed in the northern portion of the site since at least 1980; however, the historical use of the skid pad is unknown. The driving course in the northwest portion of the site was active by 1983. Building W1, Building W2, the Instructional Tower, burn pits, gas props, and the Debris Rescue Training Area were constructed and active by 1994. The Maritime Fire Trainer and associated pond were constructed in 2010. The Aircraft Rescue & Fire Fighting Simulator and associated ponds were constructed in 2013.

Activities on the site include training and certification of firefighters and emergency medical technicians, coursework for Fire Science degrees, and recertification burns. According to site personnel, the burn pits are regularly used for firefighter training and recertification burns. Aqueous Film Forming Foam (AFFF) has historically been used on the site, specifically in the area of the burn pits. AFFF is stored in bulk in conex shipping containers to the west of the fire pits and in the general fire training area in wheeled fire extinguisher carts for present-day training activities.

2.3.2 Historical Environmental Assessments

Ellis & Associates, Inc. (E&A) completed a limited soil, sediment, and groundwater assessment in the vicinity of the burn pit area of the site in 2011 and 2012. E&A completed additional groundwater assessment activities, including shallow and deep monitoring well installation and sampling in 2016, 2017, 2018, and 2019 (as ECS Florida, LLC [ECS]). Firefighter training activities within the burn pit area reportedly consisted of producing controlled fires for trainees to extinguish with AFFF (ECS, 2019). Gasoline is used as fuel for the burn pits and propane is used for fuel at the fire props and South Burn Building. After the fires were extinguished, fire pans were drained into an oil-water separator located west of the training area. Any unburned fuel product or AFFF was then pumped out of the oil-water separator and transported offsite for disposal (ECS, 2019). The purpose of the limited assessment was to screen soil, sediment, and groundwater for the presence of PFAS, based on the site's reported usage of fire-retardant materials, such as AFFF and attempt to delineate the extent of the contamination. The results of the investigation indicated that perfluoro-n-octanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS) concentrations in soil located near the burn pit area were above FDEP Provisional Soil Cleanup Target Levels (PSCTLs) for leachability. The concentrations were, however, below the PSCTLs for residential direct exposure. In addition, PFOA and PFOS concentrations in groundwater samples collected from shallow and deep monitoring wells were above Provisional Groundwater Target Cleanup Levels (PGCTLs). Well construction details are provided in Table 1. The monitoring well location map is shown on Figure 4.

According to soil boring data collected by E&A, the surficial soil is underlain by approximately 80 feet of interbedded, gray-green, calcareous, silty clay and clayey sand; fine-to-medium grained, well sorted sand; shell; and cream to brown, soft friable limestone (E&A, 2012).

2.3.3 Site Reconnaissance Activities

On June 22 and June 23, 2021, Golder and DEP representatives completed a site reconnaissance with relevant facility personnel from the Fire Academy of the South and FSCJ. During the site reconnaissance, Golder and DEP completed the following site reconnaissance activities:

- Met with the appropriate representatives from the Fire Academy of the South – FSCJ and the FDEP SIS to discuss the proposed scope of work and establish lines of communication for future field activities.
- Discussed operational history, historical PFAS-containing materials storage areas, and the historical use of PFAS-containing materials, including AFFF.
- Walked the site to identify pertinent site features and areas of concern.
- Identified existing monitoring well locations and collected depth-to-groundwater measurements using an electronic water level indicator.
- Located and documented storm water collection features.
- Collected a potable water sample (Potable-1) from a source on the south side of Building 5C to evaluate the potential for use as a PFAS free water source during site assessment activities. Golder shipped the sample to the FDEP Central Laboratory in Tallahassee, Florida for PFAS analysis (DEP SOP: LC001-3).
- Collected two surface water samples: SW-1 (collected from the pond south of the Aircraft Training Area) and SW-2 (collected from the pond northwest of the Debris Field Training Area). Golder shipped the samples to the FDEP Central Laboratory in Tallahassee, Florida for PFAS analysis (DEP SOP: LC001-3).

- Identified an equipment decontamination location and investigation derived waste (IDW) storage area south of the South Burn Building.
- Documented pre-assessment site conditions by taking photographs of relevant site features.
- Documented current storage of AFFF in containers on site.

Based on observations and discussions during site reconnaissance, the following Areas of Concern (AOC) were identified:

- AOC 1: Debris Field Training Area – This area includes the Instructional Tower; a debris rescue training area (concrete, wood, and vehicular debris); and a stormwater collection system (perimeter ditch to the south and west and catch basins within the concrete pad surrounding the Instructional Tower) that discharges into a pond.
- AOC 2: Burn Pit Training Area – This area includes the South Burn Building; a burn pit and fire pan training area; an oil-water separator (OWS); gas props; material storage area; and a stormwater collection system (perimeter ditch to the south and east). The burn pits in the southern portion of AOC 2 are fueled by gasoline supplied by underground pipes coming from an aboveground storage tank (AST) in the fuel storage area located in the southwestern portion of AOC 2. Gas props in the northern portion of AOC 2 and the burn building are fueled by propane from an AST in the fuel storage area via underground pipes. Gasoline can also be pumped into smaller containers from a pump at Building W5 for use in smaller burn pans in the vicinity of the burn pits. Water was observed at the top of the OWS vent pipe and standing above the OWS exposed vault lid, indicating water had overflowed from OWS. Additionally, a sheen was observed in the standing water on top of the OWS vault lid. Several large cracks were observed in the concrete pad surrounding the South Burn Building. This area was also the primary focus area of the E&A and ECS site assessment activities.
- AOC 3: Aircraft Rescue and Training Area – This area includes the aircraft rescue and firefighting simulator; multiple fire pans on the concrete pad surrounding the simulator; a drainage swale around the perimeter of the concrete pad; and multiple stormwater and overflow ponds. Training fires in AOC 3 are fueled by propane via underground pipes from an AST in the northeastern corner of AOC 3. The training area is designed to allow water to drain towards catch basins and a circular trench drain in the center of the training area. A valve allows water used in training to either be directed towards the stormwater pond to the south of the training area or a municipal sanitary sewer line. According to site personnel, the water used during training activities is drained to the stormwater pond and will only be directed to the municipal sanitary sewer line if AFFF is used in training. According to personnel, AFFF has not historically been used for training in AOC 3. However, site personnel reported brief use of AFFF training during liquified natural gas fire training exercises in the grassy area to the southwest of aircraft training area.
- AOC 4: Maritime Fire Training Area – This area includes the maritime fire training simulator and a stormwater collection system (catch basins within the concrete pad surrounding the simulator) that discharges into a pond.

The analytical results from the potable water sample (Potable-1) indicated that PFAS were not detected above laboratory method detection limits. DEP approved the water source for drilling and equipment decontamination water during assessment activities. The PFOS concentrations were above the FDEP Provisional Surface Water Screening Level (PSWSL) of 10 nanograms per liter (ng/L) at surface water sampling locations SW-1 (240 ng/L) and SW-2 (1,200 ng/L). The PFOA concentrations were below the PSWSL of 500 ng/L at location SW-1 and SW-2. Based on the June 2021 groundwater elevation data, the groundwater flow direction in the shallow surficial aquifer appeared to flow in multiple directions towards the existing stormwater collection features (ditches, ponds, etc.).

The groundwater flow direction in the deep surficial aquifer appeared to be towards the southeast. The AOCs are identified on Figure 3.

Golder submitted a Site Assessment Work Plan, dated September 29, 2021, to the FDEP with the purpose of delineating the nature and extent of PFAS in the site soil and groundwater and identifying other potential sources of PFAS based on the historical use and storage of PFAS containing materials including AFFF of the site. The FDEP SIS contracted Golder in November 2021 to implement the Scope of Work with subsequent modifications based on e-mail and telephone correspondence. A summary of the assessment activities is included in the following sections.

3.0 SITE ASSESSMENT ACTIVITIES

Groundwater, surface water, sediment, and soil sampling activities were completed in accordance with FDEP Standard Operating Procedures (SOPs) for Field Activities (DEP SOP-001/01), dated January 2017 (effective April 16, 2018) and FDEP SOPs for Sampling and Analysis of PFAS, dated August 2020. Field equipment and drilling equipment were decontaminated with PFAS-free water upon arrival to the site and between uses at each sampling or well location in accordance with the SOPs for Sampling and Analysis of PFAS. Drilling equipment was decontaminated within a temporary containment pad located near the South Burn Building in AOC 2. Golder did not use any known PFAS-containing materials or equipment during site assessment activities. Field documentation of site assessment activities is provided in Appendix A. A photographic log of site assessment activities is provided in Appendix B.

3.1 Site Access and Utility Clearance

Prior to mobilization, the FDEP SIS obtained site access from the State of Florida (Fire Academy of the South - FSCJ) to complete the scope of work. Based on existing soil and groundwater analytical data and observations made during the site reconnaissance, Golder and the FDEP SIS identified proposed soil sampling locations, vertical profiling locations, shallow and deep monitoring well locations, surface water sampling locations, and an exploratory boring location. Locations were marked with pin flags and/or paint on the ground surface using a handheld GPS unit. Prior to initiating site assessment activities, Golder contacted Sunshine State One Call to identify underground utilities at these locations. In addition, from November 9-10, 2021, Golder contracted GeoTek Services, LLC (GeoTek) to locate shallow subsurface utilities or other buried hazards and to verify locations marked by Sunshine State One Call. Several anomalies, which were not marked by Sunshine State One Call, were identified by GeoTek using ground penetrating radar. Soil boring and well locations located near areas of potential underground conflicts were discussed with the FDEP SIS and adjusted accordingly. No significant changes to proposed sample locations were made based on the presence of underground utilities.

3.2 Soil and Sediment Assessment

Between November 11, 2021, and March 8, 2022, following completion of the utility locations activities, Golder advanced 115 soil borings and collected soil samples at the site. Soil samples were collected from the following locations:

- AOC 1: Debris Field Training Area – 10 locations (DEPSB-1 through DEPSB-10).
- AOC 2: Burn Pit Training Area – 81 locations
  - Gas Props – 27 locations (DEPSB-32 through DEPSB-58) in the gas props training area to the north of the burn building.
  - Burn Pits – 45 locations (DEPSB-66 through DEPSB-110) in the burn pit area to the south of the burn building.
  - Nine locations (DEPSB-59 though DEPSB-65, DEPSB-112, and DEPSB-113) in the paved and grassy areas surrounding the gas props, burn building, and burn pits.
- AOC 3 – Aircraft Training Area: 12 soil borings (DEPSB-20 through DEPSB-31) were advanced in grassy areas around the perimeter of the paved aircraft training area.

- AOC 4 – Maritime Fire Training Area: 10 soil borings (DEPSB-11 through DEPSB-19 and DEPSB-111) were advanced around the perimeter of the Maritime Fire Trainer.
- Emergency Vehicle Driver Training Area: Two soil borings (DEPSB-114 and DEPSB-115) were advanced at shallow monitoring well locations in the driver training area in the northern portion of the site.

In addition, Golder collected 15 sediment samples (SED-1 through SED-15) at the following locations:

- Three sediment samples were collected from the pond (SED-2 and SED-6) and a stormwater drainage ditch (SED-5) located in AOC 1.
- Two sediment samples (SED-9 and SED-10) were collected from drainage ditches in AOC 2.
- Three sediment samples (SED-1, SED-12, and SED-13) were collected from the pond and low-lying drainage areas located in AOC 3.
- Three sediment samples were collected from the pond (SED-7 and SED-8) and a low-lying drainage area (SED-14) located in AOC 4. Sample location SED-8 was sampled twice on separate dates.
- Two sediment samples (SED-3 and SED-4) were collected from the east-west running creek to the south of the powerline easement on the southern boundary of the site.
- One sediment sample (SED-11) was collected in the low-lying, wooded area (wetland) to the east of AOC 2.
- One sediment sample (SED-15) was collected from the pond located in the northwestern corner of the site to the north of the Emergency Vehicle Driver Training Area.

The soil sampling locations are shown on Figure 5, Figure 5A (AOC 1 and Emergency Vehicle Driver Training Area), Figure 5B (AOC 2 North), Figure 5C (AOC 2 South), Figure 5D (AOC 3), and Figure 5E (AOC 4). The sediment sample locations are shown on Figure 6.

At each soil sampling location, Golder used a decontaminated stainless-steel hand auger to collect soil samples from the ground surface to the top of the water table. In general, the water table was encountered between 1 and 4 feet bgs. Golder collected a minimum of two soil samples per location: 0 to 0.5 feet bgs and 0.5 feet bgs to 2 feet bgs (unless the water table was observed less than 2 feet bgs). If the water table was observed at a depth greater than 2 feet bgs, Golder collected a third soil sample between 2 feet bgs and the water table. Golder placed soil from each interval on clear polyethylene sheeting for mixing prior to placement into laboratory-supplied containers. The sediment samples were also collected using a decontaminated stainless-steel hand auger.

Golder prepared the chain-of-custody documentation and placed the soil samples and sediment sample in coolers with ice for transportation to the FDEP Central Laboratory. The FDEP Central Laboratory analyzed the soil and sediment samples for PFAS using DEP SOP: LC-001-3. Due to the presence of a sheen on top of the OWS in AOC 2, samples from soil borings DEPSB-107 through DEPSB-110 were additionally analyzed for semi-volatile organic compounds (SVOCs) using EPA 8270E, volatile organic compounds (VOCs) using EPA 8260D, and total recoverable petroleum hydrocarbons (TRPH) using the FL-PRO method.

In general, the soils and sediment encountered during soil sampling activities were dark brown and gray fine sand and fine sand-organics mixtures extending from the ground surface to approximately 4 feet bgs. A semi-permeable hardpan layer of varying thickness was observed across the site, generally beginning in the top 4 feet bgs and extending intermittently to approximately 20 feet bgs. Groundwater was observed between one and four feet bgs

in boreholes across the site. Groundwater elevation appeared to be dependent on the soil boring proximity to stormwater features and low-lying areas. Soil boring logs and field documentation are provided in Appendix A.

3.3 Surface Water Assessment

Between June 23, 2021 and March 8, 2022, Golder collected 12 surface water samples at the following locations:

- Three surface water samples were collected from the pond (SW-2 and SW-6) and a stormwater drainage ditch (SW-5) located in AOC 1.
- Two surface water samples (SW-9 and SW-10) were collected from drainage ditches in AOC 2.
- One surface water sample (SW-1) was collected from the pond located in AOC 3.
- Two surface water samples (SW-7 and SW-8) were collected from the pond in AOC 4.
- Two surface water samples (SW-3 and SW-4) were collected from the east-west running creek to the south of the powerline easement on the southern boundary of the site.
- One surface water sample (SW-11) was collected in the low-lying, wooded area (wetland) to the east of AOC 2.
- One surface water sample (SW-12) was collected from the pond located in the northwestern corner of the site and north of the Emergency Vehicle Driver Training Area.

The surface water sample locations are shown on Figure 7.

Surface water samples were collected using a low-flow peristatic pump. The intake end of the tubing was affixed to a telescoping pole and placed in an area free of algae and other debris. The approximate sample depths were 6 inches below the top of the water. Three equipment volumes were purged at each sampling location before collecting field parameters, which included temperature, pH, specific conductance, dissolved oxygen, and turbidity. Field parameters were recorded on surface water sampling data sheets, which along with the equipment calibration records are also included in Appendix A.

Golder prepared the chain-of-custody documentation and placed the surface water samples in coolers with ice for transportation to the FDEP Central Laboratory. The FDEP Central Laboratory analyzed the samples for PFAS using DEP SOP: LC-001-3.

3.4 Exploratory Lithologic Boring

On March 14, 2022, a mini-sonic drill rig was used to advance an exploratory soil boring (Exploratory Boring) under the direct supervision of a Golder geologist to determine continuous lithologic profiles, which were used to identify potential aquitards, determine the thickness of the any identified low permeability clay zones and any zones of higher permeability. The exploratory boring was advanced in the grassy area in the northern portion of AOC 2, south of Building W2. The target depth of the exploratory boring was 100 feet bgs or the bottom of the first high-permeability zone within the Hawthorn Formation. Based on lithologic observations made during advancement and correspondence with the FDEP, the exploratory boring was terminated at 70 feet bgs. The exploratory boring location is shown on Figure 4.

In general, fine to silty sands and interbedded layers of dark brown silty sand with organics (hardpan) were encountered from the surface to approximately 34 feet bgs. Fine to silty sand containing approximately 35 percent shell hash (up to two inches) was observed from approximately 34 to 48 feet bgs. A low permeability clay

(95 percent) and shell hash (5 percent) unit was observed from approximately 48 to 52.5 feet bgs followed by silty sand with shell hash to approximately 55 feet bgs. Gray limestone was observed from 55 to 55.5 feet bgs. Low permeability clays and clay, silty sand, shell mixtures were observed from 55.5 to 70 feet bgs. The exploratory boring log is provided Appendix A.

3.5 Groundwater Assessment

3.5.1 Shallow Monitoring Well Installation

Between December 14, 2021, and March 7, 2022, Golder oversaw the use of direct-push technology (DPT) rigs to install 10 shallow zone monitoring wells (DEPMW-1S through DEPMW-10S) in the surficial aquifer at the locations shown on Figure 4.

Once the utilities were marked at ground surface, each well location was cleared for the presence of buried utilities using a hand auger to a minimum depth of 5 feet bgs. The monitoring wells were constructed of 0.75-inch diameter, Schedule 40 PVC casing with pre-packed 0.01-inch diameter slot size screen and 0.75-inch diameter, Schedule 40 PVC riser. Each screen was 10 feet in length and installed to a total depth of approximately 12 feet bgs. The well risers and screens were connected via flush-threaded joints. The annular space between the borehole wall and each well screen was completed with a pre-packed 20/30 grade silica sand filter pack from the bottom of the borehole to the top of the well screen. A 20/30 grade silica sand filter pack was then placed a minimum of 1 foot above the top of the well screen. A 6-inch thick, fine (30/65) grade silica sand seal was placed above the sand filter pack and the remainder of the annular space was completed with a Portland Cement Type II grout seal.

The monitoring wells were finished with flush-mounted surface completion and an 8-inch diameter bolt-down steel cover. The risers were capped with water-tight expandable locking plugs. A 2-foot by 2-foot concrete pad was constructed around the well to secure the flush-mounted vault, which was sloped away from the well to prevent surface water infiltration.

To remove fine grained particles in the filter pack and adhered to the borehole wall, and to establish a good hydraulic connection with the aquifer, each monitoring well was developed until the purged water remains visibly clear and free of suspended particulate matter. Monitoring well construction details are summarized in Table 1. Field documentation, including shallow monitoring well installation logs are provided in Appendix A.

3.5.2 Vertical Groundwater Profiling

On December 13, 2021, Golder and FDEP oversaw the use of a DPT rig equipped with GeoProbe K6300 flow control module, GeoProbe FI6000 data acquisition instrument, and hydraulic profiling tool (HPT) to assess hydraulic conductivity (K) at locations in AOC 1 (DEPMW-1S location) and AOC 2 (DEPMW-2S location). The HPT was able to measure K values continuously to approximately 65 feet bgs at each location. After reviewing the K values measured by the HPT with the FDEP site manager, vertical groundwater profiling sample intervals were adjusted from the proposed scope of work to collect groundwater samples from intervals with higher K values to a depth of 52 feet bgs.

On December 14, 2021, and on March 7 and 8, 2022, Golder oversaw the use of a DPT rig to complete vertical groundwater profiling. Vertical profiling points were advanced at the following four locations:

- AOC 1: Vertical profiling location VP-1 was located in the western portion of the debris field training area, adjacent to monitoring wells DEPMW-8S and DEPMW-1D.

- AOC 2: Vertical profiling location VP-2 was located in the northern portion of AOC 2 in a grassy area between the gas props and Building W2, next to monitoring wells DEPMW-2S, DEPMW-2D, and the exploratory soil boring.
- AOC 3: Vertical profiling location VP-3 was located in the grassy area off the southeastern edge of the aircraft rescue and fire training simulator pad, next to monitoring wells DEPMW-3S and DEPMW-3D.
- AOC 4: Vertical profiling location VP-4 was located east of the maritime fire training simulator and next to monitoring wells DEPMW-4S and DEPMW-4D.

The vertical profiling locations are shown on Figure 5.

Once the utilities were marked at ground surface, each profiling location was cleared for the presence of buried utilities using a hand auger to a minimum depth of 5 feet bgs. Golder collected groundwater samples using DPT tooling (4-foot screens) at three depth intervals that were predetermined based on HPT-derived K values and correspondence with the FDEP. The samples were collected from the following depth intervals: 20 to 24 feet bgs, 36 to 40 feet bgs, and 48 to 52 feet bgs. The samples were analyzed by the FDEP Central Laboratory for PFAS using DEP SOP: LC-001-3. The drilling contractor decontaminated the drilling rods, DPT screens, hand augers, and other relevant equipment upon arrival at the site and after each sample was collected. Field documentation, including the vertical profile groundwater sampling logs and HPT logs are provided in Appendix A.

3.5.3 Deep Monitoring Well Installation

On March 15 and 16, 2022, Golder oversaw the use of a mini-sonic drill rig to install four deep zone monitoring wells (DEPMW-1D through DEPMW-4D) at the locations shown on Figure 4. Each well location was cleared for the presence of buried utilities using a hand auger to a minimum depth of 5 feet bgs. The monitoring wells were constructed of 2-inch diameter, Schedule 40 PVC casing with a 0.01-inch diameter slot size screen and 2-inch diameter, Schedule 40 PVC riser. Each screen was 10 feet in length and installed to a total depth of approximately 50 feet bgs. The well risers and screens were connected via flush-threaded joints. A 20/30 grade silica sand filter pack was then placed to two feet above the top of the well screen. A 1-foot thick, fine (30/65) grade silica sand seal was placed above the sand filter pack and the remainder of the annular space was completed with a Portland Cement Type II grout seal.

Deep well DEPMW-2D was constructed in the exploratory boring borehole. The borehole collapsed from its total depth of 70 feet bgs to 55 feet bgs. The borehole was backfilled with hydrated bentonite pellets from 55 to 49 feet bgs, followed by 20/30 grade silica sand to 47 feet bgs. Water from the drill rig was used to pressurize the bentonite in the borehole, which compressed and formed a solid surface seal at 49 feet bgs, and the well was constructed as described above.

The monitoring wells were finished with flush-mounted surface completion and an 8-inch diameter bolt-down steel cover. The risers were capped with water-tight expandable locking plugs. A 2-foot by 2-foot concrete pad was constructed around the well to secure the flush-mounted vault, which was sloped away from the well to prevent surface water infiltration.

To remove fine grained particles in the filter pack and adhered to the borehole wall, and to establish a good hydraulic connection with the aquifer, each monitoring well was developed until the purged water remains visibly clear and free of suspended particulate matter. Monitoring well construction details are summarized in Table 1. Field documentation, including deep monitoring well installation logs are provided in Appendix A.

3.6 Groundwater Sampling

Golder mobilized to the site during the week of April 4, 2022, and collected groundwater samples from the 14 newly installed FDEP monitoring wells, 21 wells previously installed by E&A/ECS, and 4 JEA municipal supply wells (39 wells total). Golder could not collect a sample from monitoring well FSCJ-TMW-19S due to debris covering the well at the time of the sampling event. The wells sampled in the shallow zone of the surficial aquifer were as follows: DEPMW-1S through DEPMW-10S, FSCJ-TMW-1S, FSCJ-TMW-2SR, FSCJ-TMW-3S, FSCJ-TMW-4SR, FSCJ-TMW-6S, FSCJ-TMW-7SR, FSCJ-TMW-8S through FSCJ-TMW-18S, and FSCJ-TMW-20S (28 wells). The wells sampled in the deep zone of the surficial aquifer were as follows: DEPMW-1D through DEPMW-4D, FSCJ-TMW-2D, FSCJ-TMW-4DR, and FSCJ-TMW-6D (seven wells). The following JEA municipal supply wells (screened in the Floridan Aquifer with total depths from 440 to 1,000 feet, based on information gathered and presented in the September 2021 Site Assessment Work Plan) were sampled: Well 1, Well 5, Well 6, and Well 7 (four wells of seven wells in JEA's Oakridge supply well group).

Prior to groundwater sampling, the water level depth was measured at each well to be sampled to determine groundwater elevations across the site. The water level depth could not be collected at the JEA supply wells. Prior to collecting the groundwater sample, each well was purged and field parameters including temperature, pH, specific conductance, dissolved oxygen, turbidity, and oxidation-reduction potential were monitored. JEA personnel reportedly pumped the supply wells for at least two hours prior to sampling. Water was allowed to purge though dedicated sample ports for five minutes, a single set of field parameters was recorded, then the laboratory sample was collected. Purge volumes and field parameters were recorded on field data sheets, and the field monitoring equipment was calibrated in accordance with the manufacturer's recommended procedures. Relevant sampling equipment was decontaminated after each sample was collected.

Golder prepared the chain-of-custody documentation and placed the samples in coolers with ice for transportation to the FDEP Central Laboratory. The FDEP Central Laboratory analyzed the samples for PFAS using DEP SOP LC-001-3. Samples from wells DEPMW-2S, DEPMW-8S, FSCJ-TMW-2SR, FSCJ-TMW-3S, FSCJ-TMW-11S, FSCJ-TMW-12S, FSCJ-TMW-17S, FSCJ-TMW-18S, and FSCJ-TMW-2D were additionally analyzed for SVOCs using EPA 8270E, VOCs using EPA 8260D, and TRPH using EPA FL-PRO. Field documentation is included in Appendix A.

3.7 Well Survey

The wells listed in the previous section were surveyed by Banks & Banks Consulting, Inc. (Banks), a Florida-licensed professional land surveyor, for top-of-well casing elevations (+/- 0.01 feet accuracy) and well spatial arrangement (+/- 0.1 feet accuracy). The horizontal datum was recorded in the North American Datum (NAD) 1983, Florida East Zone State Plane Coordinate system. The vertical datum was recorded in North American Vertical Datum of 1988 (NAVD 88). The survey results are summarized in Tables 1. The Banks report is included in Appendix C.

3.8 Investigation Derived Waste

Soil cuttings, equipment decontamination water, and well development and purge water from site assessment activities were placed in 55-gallon drums, appropriately labeled as IDW, and temporarily staged on the pavement to the south of the South Burn Building in AOC 2. Golder used the soil and groundwater analytical results for waste characterization purposes.

Clark Environmental Inc. (Clark) transported and disposed of four drums containing IDW liquids on February 1, 2022. Clark transported and disposed of four drums containing IDW soil cuttings and 17 drums containing IDW liquids (decontamination, well development, and groundwater sampling purge water) on May 23, 2022. The drum contents were initially transported to Clark's facility at 755 North Prairie Industrial Parkway in Mulberry, Florida for stabilization. The contents were then disposed at the Republic Services Cedar Trails facility in Bartow, Florida. The non-hazardous waste manifests are included in Appendix D.

4.0 ANALYTICAL RESULTS

4.1 Soil and Sediment

The FDEP has derived leachability-based PSCTLs of 2 micrograms per kilogram (µg/kg) for PFOA and 7 µg/kg for PFOS concentrations. At this time, the FDEP has directed Golder to use the PSCTLs for both soil and sediment.

The reported PFOA concentrations in soil were above the leachability-based PSCTL of 2 µg/kg in 5 of the 115 sample locations (DEPSB-4, DEPSB-48, DEPSB-51, DEPSB-54, and DEPSB-74). The exceedances ranged from 2.8 µg/kg to 7.1 µg/kg. One PFOA concentration exceedance was from a sample collected in AOC 1 and four were from samples collected in AOC 2.

The reported PFOS concentrations in soil were above the leachability-based PSCTL of 7 µg/kg in 72 of the 115 sample locations. A brief summary of the PFOS results is as follows:

- The exceedances in AOC 1 (Debris Field Training Area – seven locations) ranged from 8.5 µg/kg to 500 µg/kg.
- The exceedances in the northern portion of AOC 2 (Burn Pit Training Area – 27 locations) ranged from 7.6 µg/kg to 1,400 µg/kg. The PFOS concentration of 1,400 µg/kg in the soil sample collected from the 0.5 to 2.0 feet bgs depth interval at location DEPSB-48, which was located near the gas props, was also above the PSCTL for residential direct exposure. This was the only soil sample collected during site assessment activities with a PFOS concentration above the PSCTL for residential direct exposure.
- The exceedances in the southern portion of AOC 2 (Burn Pit Training Area – 35 locations) ranged from 7.6 µg/kg to 390 µg/kg.
- The exceedances in AOC 3 (Aircraft Training Area – three locations) ranged from 9.4 µg/kg to 11 µg/kg.
- The PFOS concentrations in AOC 4 (Maritime Fire Training Area) and the Emergency Driver Training Area were below the leachability-based PSCTL.

The SVOC, VOC, and TRPH concentrations in the soil samples collected from borings DEPSB-107 through DEPSB-110, which were located next to the oil-water separator in AOC 2, were below their respective SCTLs and/or laboratory method detection limits.

The reported PFOA concentrations were above the leachability-based PSCTL of 2 µg/kg at three of the 15 sediment sample locations (SED-5, SED-10, and SED-11) and ranged from 4.1 µg/kg to 15 µg/kg. The reported PFOS concentrations were above the leachability-based PSCTL of 7 µg/kg at eight of the 15 sediment sample locations (SED-2, SED-5, SED-6, SED-9, SED-10, SED-11, SED-14, and SED-15) and ranged from 11 µg/kg to 870 µg/kg. The highest PFOS concentrations were observed in the drainage ditch bordering AOC 1 and AOC 2 and the low-lying, wooded area (wetlands) to the east of AOC 2.

A summary of the detected PFAS in soil is provided in Table 2. A summary of the VOC constituents and TRPH in soil is provided in Table 3. A summary of SVOC constituents in soil is provided in Table 4. A summary of the detected PFAS in sediment is provided in Table 5. The soil analytical results are shown on Figure 5A (AOC 1 and Emergency Vehicle Driver Training Area), Figure 5B (AOC 2 North), Figure 5C (AOC 2 South), Figure 5D (AOC 3), and Figure 5E (AOC 4). The sediment analytical results are shown on Figure 6. The laboratory analytical reports are included in Appendix E.

4.2 Surface Water

The FDEP has derived PSWSLs of 500 ng/L for PFOA and 10 ng/L for PFOS concentrations. These screening levels are protective of human health for both freshwater and estuarine finfish and shellfish species. Golder observed site personnel fishing in the onsite ponds during site assessment activities. It is unknown whether the fish are kept for human consumption.

The reported PFOA concentrations were above the PSWSL of 500 ng/L at SW-9 (530 ng/L) and SW-10 (820 ng/L). The reported PFOS concentrations were above the PSWSL of 10 ng/L at each of the 12 surface water sampling locations and ranged from 12 ng/L to 14,000 ng/L. The highest PFOS concentrations (greater than 1,000 ng/L) were observed in the drainage ditch bordering AOC 1 and AOC 2, the stormwater pond in AOC 1, and the low-lying, wooded area (wetland) to the east of AOC 2.

The FDEP has also derived PSWSLs for PFOA and PFOS that are protective of ecology in both freshwater and marine environments. The reported PFOA and PFOS concentrations associated with this study were below the PSWSLs for freshwater. There are no marine environments at the site.

A summary of the detected PFAS in surface water is provided in Table 6. The PFOA and PFOS results from surface water samples are shown on Figure 7. The laboratory analytical reports are included in Appendix E.

4.3 Groundwater

4.3.1 Groundwater Elevations

On April 4, 2022, the depth-to-groundwater was measured and recorded at each well location using an electronic water level indicator. The surficial aquifer was subdivided into two zones, the shallow zone of the surficial aquifer and the deep zone surficial aquifer. The shallow zone consists of wells screened to a total depth of 11 to 12 feet bgs. The deep zone consists of wells screened to a total depth of approximately 50 or 60 feet bgs. Monitoring well FSCJ-TMW-19S was covered with debris at the time of the sampling event and could not be used for groundwater elevations. The depth-to-groundwater measurements and calculated groundwater elevations are summarized in Table 7. Due to the construction of the JEA supply wells, their depth-to-groundwater measurements could not be collected. The potentiometric map of the shallow zone of the surficial aquifer is shown on Figure 8. The potentiometric map of the deep zone of the surficial aquifer is shown on Figure 9.

The groundwater gradient in the shallow surficial aquifer generally flows away from developed portions of the site and towards the perimeter ditches, stormwater ponds, and adjacent low-lying swales to the east and west of the site. Multiple stormwater features exist on the site to direct stormwater and water used during training towards stormwater ponds and low-lying areas on site and towards the low-lying swales to the east and west of the site.

Based on the April 2022 groundwater elevation data, the groundwater gradient in the deep surficial aquifer is generally towards the southeast. Variability due to surface conditions observed in the shallow surficial aquifer is not observed the deep surficial aquifer.

4.3.2 Vertical Profiling

Golder collected groundwater samples from four vertical profiling locations at the following depth intervals: 20 to 24 feet bgs, 36 to 40 feet bgs, and 48 to 52 feet bgs. A brief summary of the results is presented below:

- AOC 1 (Debris Field Training Area, VP-1): The PFOA concentrations were above the PGCTL of 70 ng/L at the 20 to 24 feet bgs interval (330 ng/L) and the 36 to 40 feet bgs interval (1,400 ng/L). The PFOS

concentrations were above the PGCTL of 70 ng/L at each depth interval, with the highest concentration at the 20 to 24 feet bgs depth interval (12,000 ng/L). The combined PFOA and PFOS concentrations were above the PGCTL of 70 ng/L at each interval. The highest combined concentration was at the 20 to 24 feet bgs interval (12,330 ng/L); the lowest combined concentration was at the 48 to 52 feet bgs interval (344 ng/L).

- AOC 2 (Burn Pit Training Area, VP-2): The PFOA concentration was above the PGCTL at the 20 to 24 feet bgs depth interval (370 ng/L). The PFOS concentration was also above the PGCTL at the 20 to 24 feet bgs depth interval (5,300 ng/L). The combined PFOA and PFOS concentrations were above the PGCTL of 70 ng/L at the 20 to 24 feet bgs interval (5,670 ng/L). The PFOA, PFOS, and combined PFOA and PFOS concentrations were below the PGCTL at the two deeper depth intervals.
- AOC 3 (Aircraft Rescue and Training Area, VP-3): The PFOA, PFOS, and combined PFOA and PFOS concentrations were below their PGCTLs at each depth interval.
- AOC 4 (Maritime Fire Training Area, VP-4): The PFOA concentrations were below the PGCTL at each depth interval. The PFOS and combined PFOA and PFOS concentrations were below their PGCTLs in the 36 to 40 feet bgs interval. The PFOS concentrations were above the PGCTL at the 20 to 24 feet bgs interval (300 ng/L) and the 48 to 52 feet bgs interval (740 ng/L). The combined PFOA and PFOS concentrations were above the PGCTL at the 20 to 24 feet bgs interval (323 ng/L) and the 48 to 52 feet bgs interval (827 ng/L).
- In general, the highest PFAS concentrations were observed in AOC 1 and AOC 2. PFAS concentrations generally decreased with depth; however, at VP-4 in AOC 4, the highest PFOA and PFOS concentrations were observed at the deepest depth interval (48 to 52 feet bgs). High relative concentrations of short-chain (C6 or less) carboxylates, including perfluorohexanoic acid (PFHxA), perfluoropentanoic acid (PFPeA), and perfluorobutanoic acid (PFBA); short to long-chain sulfonates, including perfluorohexanesulfonic acid (PFHxS), perfluoropentanesulfonic acid (PFPeS), and perfluorobutanesulfonic acid (PFBS); and the short-chain fluorotelomer 6:2 fluorotelomer sulfonate (6:2 FTS) were also reported in samples with higher PFOA and PFOS concentrations. These PFAS were also reported in samples where PFOA and PFOS were below the PGCTL, including the VP-3 samples in AOC 3.

A summary of the detected PFAS at each of the vertical profiling locations is provided in Table 8. The PFOA and PFOS results from each vertical profiling location are shown on Figure 10. The laboratory analytical reports are included in Appendix E.

4.3.3 Monitoring Well and Municipal Supply Well Analytical Results

A summary of the groundwater field parameters is provided in Table 9. A summary of the detected PFAS in shallow and deep zone groundwater is provided in Table 10. A summary of the VOC, SVOC, and TRPH results are provided in Table 11. The PFOA and PFOS results from the shallow zone of the surficial aquifer are shown on Figure 11. The PFOA and PFOS results from the deep zone of the surficial aquifer are shown on Figure 12. The PFOA and PFOS results from the JEA supply wells are shown on Figure 13. The laboratory analytical reports are included in Appendix E.

4.3.3.1 Shallow Zone of the Surficial Aquifer

Golder collected groundwater samples from shallow zone monitoring wells DEPMW-1S through DEPMW-10S, FSCJ-TMW-1S, FSCJ-TMW-2SR, FSCJ-TMW-3S, FSCJ-TMW-4SR, FSCJ-TMW-6S, FSCJ-TMW-7SR, FSCJ-TMW-8S through FSCJ-TMW-18S, and FSCJ-TMW-20S (28 wells). The results are summarized as follows:

- The reported PFOA concentrations were above the PGCTL of 70 ng/L at 18 of the 28 well locations. The PFOA concentrations ranged from 82 ng/L (DEPMW-3S) to 2,500 ng/L (DEPMW-6S) in these 18 locations.
- The reported PFOS concentrations were above the PGCTL of 70 ng/L at 21 of the 28 well locations The PFOS concentrations ranged from 82 ng/L (FSCJ-TMW-10S) to 72,000 ng/L (DEPMW-6S) at these 21 locations.
- The reported combined PFOA/PFOS concentrations were above the PGCTL of 70 ng/L at 25 of the 28 well locations. The combined PFOA/PFOS concentrations ranged from 117 ng/L (FSCJ-TMW-6S) to 74,500 ng/L (DEPMW-6S) at these 25 locations.
- High relative concentrations of short-chain (C6 or less) carboxylates, including PFHxA, PFPeA, and PFBA; short to long-chain sulfonates, including PFHxS, PFPeS, and PFBS; and the short-chain 6:2 FTS were reported in samples with higher PFOA and PFOS concentrations. In addition, perfluoro-1-hexane sulfonamide (FHxSA) was also reported at high relative concentrations, particularly in the vicinity of the burn pits in AOC 2.
- PFOA and PFOS concentrations are present in shallow groundwater at concentrations above the PGCTLs across the site. The horizontal extent has not been well defined in any direction. The combined PFOA/PFOS concentrations were consistently the highest in AOC 1 and AOC 2; however, the highest concentration (74,500 ng/L) was observed in the sample collected from monitoring well DEPMW-6S, which is located in the southern portion of AOC 3. The combined PFOA/PFOS concentrations from wells in this area are generally two orders of magnitude less than the concentration observed at monitoring well DEPMW-6S, indicating a potentially isolated release. The soil analytical results collected in AOC 3, however, do not appear to correlate with the high groundwater concentration observed at monitoring well DEPMW-6S.

4.3.3.2 Deep Zone of the Surficial Aquifer

Golder collected groundwater samples from deep zone monitoring wells DEPMW-1D through DEPMW-4D, FSCJ-TMW-2D, FSCJ-TMW-4DR, and FSCJ-TMW-6D (seven wells). The results are summarized as follows:

- The reported PFOA concentration was above the PGCTL of 70 ng/L at monitoring well DEPMW-1D (1,300 ng/L). The reported PFOA concentrations at the other locations were below the PGCTL.
- The reported PFOS concentration was above the PGCTL of 70 ng/L at monitoring well DEPMW-1D (5,900 ng/L). The reported PFOS concentrations at the other locations were below the PGCTL.
- The reported combined PFOA/PFOS concentrations were above the PGCTL of 70 ng/L at monitoring wells DEPMW-1D (7,200 ng/L) and FSCJ-TMW-2D (72 ng/L). The reported combined PFO/PFOS concentrations were below the PGCTL at the other locations.
- As discussed in Section 4.3.2, the highest PFOA and PFOS concentrations were observed at the deepest depth interval (48 to 52 feet bgs) at vertical profile location VP-4 in AOC 4; however, the PFOA and PFOS concentrations in deep monitoring well DEPMW-4D (installed at same location) were below PGCTLs.

- With the exception of deep monitoring well DEPMW-1D (AOC 1), the PFAS concentrations in deep zone groundwater were observed to be significantly less than those observed in the shallow zone groundwater. This observation is generally consistent with the results of the groundwater vertical profiling (see Section 4.3.2).
- While the PFOS concentration was slightly lower, the PFOA concentration at deep monitoring well DEPMW-1D was higher than the PFOA concentration at its corresponding shallow monitoring well DEPMW-8S. The PFOA and PFOS concentrations in soil were above the leachability-based PSCTLs in this area.

4.3.3.3 JEA Municipal Supply Wells

Golder collected groundwater samples from four JEA municipal supply wells associated with the Oakridge wellfield (Well 1, Well 5, Well 6, and Well 7). The wells are screened in the Floridan Aquifer with total depths from ranging from 440 to 1,000 feet bgs. No PFAS were detected at concentrations above laboratory method detection limits in the JEA municipal supply wells.

4.3.4 AFFF Analytical Results

Golder observed the presence of various AFFF products onsite during the June 2021 site reconnaissance and subsequent field activities. These products included Aer-O-Lite™ 3% AFFF, Chemguard 3% x 6% Alcohol Resistant AFFF, and Ansulite 3% x 3% AFFF (Ansulite). Golder collected a sample of the Ansulite product on December 15, 2021 and submitted the sample to the FDEP Central Laboratory for PFAS analysis. As shown in Table 12, the following PFAS were detected at concentrations above the laboratory method detection limit: PFBA (210 ng/L), PFPeA (250 ng/L), PFHxA (2,800 ng/L), PFOA (25 ng/L), PFOS (240 ng/L), and 6:2 FTS (7,700 ng/L).

4.4 Data Evaluation

4.4.1 Primary Source Areas

The results of the site assessment activities indicate that there are likely multiple source areas located at the site. The highest PFAS concentrations in soil, sediment, surface water, and groundwater were generally observed in AOC 1 (Debris Field Training Area) and AOC 2 (Burn Pit Training Area), where fire training activities have been conducted since the early 1990s. The high concentrations of PFOS in each media suggest the historical use of Legacy PFOS AFFF in AOC 1 and AOC 2. Legacy PFOS AFFF was manufactured from the late 1960s until 2002 and contained “PFOS and various precursors that could break down in the environment to PFOS and short-chain sulfonate PFAS, such as PFHxS” (ITRC, 2020). In addition, older formulations contained PFOA and fluorinated precursors, which could break down to PFOA and short-chain carboxylate PFAS (ITRC, 2020).

The presence of PFOA, 8:2 fluorotelomer sulfonate (8:2 FTS), 6:2 FTS, and PFHxA also suggests some historical use of Legacy Fluorotelomer AFFF, which was manufactured from the 1970s until 2016 and contains both short chain and replacement long chain fluorotelomers that can degrade to PFOA (ITRC, 2020). High relative concentrations of short-chain (C6 or less) carboxylates in groundwater, including PFHxA, PFPeA, and PFBA; short to long-chain sulfonates, including PFHxS, PFPeS, and PFBS; and the short-chain 6:2 FTS were reported in samples with higher PFOA and PFOS concentrations.

In addition, FHxSA was also reported at high relative concentrations (e.g., FSCJ-TMW-2SR and FSCJ-TMW-3S), particularly in the vicinity of the burn pits in AOC 2. A summary of the percent relative abundance of PFAS constituents in groundwater is shown in Table 12. FHxSA is a PFAS that has also been reported in older formulations of AFFF, alongside with PFOS, PFHxS and longer-chain PFAS compounds (Eurofins, 2021).

The soil analytical results indicate PFOA and PFOS concentrations are above leachability-based PSCTLs in vadose zone soil within AOC 1 and AOC 2. The soil analytical results from samples collected north of AOC 1 and AOC 2 (DEPSB-10, DEPSB-59, DEPSB-114, and DEPSB-115) and from south of AOC 2 (DEPSB-31) were below PSCTLs; however, additional samples will likely need to be collected south, east, and west of AOC 1 and east and west of AOC 2, if feasible, to determine the horizontal extent of the impacts. Golder observed that the areas east and west of AOC 1 and AOC 2 generally consist of low-lying, wooded areas (wetlands).

The groundwater analytical results indicate PFOA and PFOS concentrations are present in shallow groundwater at concentrations above the PGCTLs across the site, with the exception of upgradient well MW-10S. The downgradient horizontal extent of PFOA and PFOS impacts above the PGCTLs has not been delineated in shallow groundwater. The combined PFOA/PFOS concentrations were consistently the highest in AOC 1 (shallow and deep zone) and AOC 2 (shallow zone); however, the highest concentration was observed in the sample collected from monitoring well DEPMW-6S, which is located in the southern portion of AOC 3 (see next section for discussion). Golder recommends installing additional shallow zone monitoring wells in accessible areas along the site boundary.

The sediment and surface water analytical results suggest that PFAS present in the run-off associated with fire training activities in AOC 1 and AOC 2 have entered the stormwater collection system (perimeter ditch to the south, east, and west and various catch basins) that discharges into the pond in AOC 1. The sediment and surface water analytical results east of AOC 2 (SED-11 and SW-11) and south of AOC 1 (SED-14) indicate that the impacts are not limited to the collection system. Golder is unaware if any flow in the perimeter ditch is diverted into the low-lying, wooded areas (wetlands) surrounding AOC 1 and AOC 2. Golder recommends delineating the sediment and surface water impacts at the site.

Given the high concentrations of PFOA and PFOS in groundwater within AOC 1 and AOC 2, Golder recommends that the FDEP consider the effectiveness and feasibility of an Interim Source Removal (ISR) to address soil with concentrations above leachability-based PSCTLs.

4.4.2 Secondary Source Areas

The Maritime Fire Trainer and associated pond in AOC 4 were constructed in 2010. The Aircraft Rescue & Fire Fighting Simulator and associated ponds in AOC 3 were constructed in 2013. The soil analytical results from samples collected in these two areas were relatively low. PFOA concentrations in soil were below the PSCTL in both areas. PFOS concentrations were slightly above the PSCTL in AOC 3 (maximum concentration of 11 µg/kg) and below the PSCTL in AOC 4. The PFOA and PFOS concentrations in groundwater generally decrease in AOC 3 and AOC 4, when compared to concentrations observed in AOC 1 and AOC 2, with the exception of the results at shallow zone monitoring wells DEPMW-4S, DEPMW-6S, FSCJ-TMW-4SR, and FSCJ-TMW-8S. Monitoring wells DEPMW-6S, FSCJ-TMW-4SR, and FSCJ-TMW-8S are generally downgradient from and likely impacted by source areas located on AOC 1 and AOC 2. The combined PFOA/PFOS concentrations from wells in this area are generally two orders of magnitude less than the concentration observed at monitoring well DEPMW-6S, indicating a potentially isolated release near DEPMW-6S. Notably, the 6:2 FTS concentration at monitoring well DEPMW-6S was the highest reported during assessment activities at 140,000 ng/L. As discussed above, the soil analytical results from AOC 3 and AOC 4 do not appear to correlate with the high groundwater concentrations observed in DEPMW-6S. Golder recommends collecting an additional groundwater sample from DEPMW-6S to confirm the results. If confirmed, Golder recommends additional soil sampling in vicinity of DEPMW-6S.

The PFOS concentration observed at monitoring well DEPMW-9S (3,600 ng/L) suggests an additional source area may be present near the skid pad and north of AOC 1 and AOC 2. Golder recommends additional assessment activities in the vicinity of the skid pad.

4.4.3 PFAS Radar Plots

Golder also prepared radar plots showing short and long-chain PFAS concentrations in each AOC to allow for an effective evaluation of PFAS signatures in samples collected from shallow and deep monitoring wells and surface water across the site. The radar plots are included in Appendix F. Golder also included the radar plot for the Ansulite sample on each chart to evaluate that product as a potential source of the PFAS contamination. Overall, the PFAS signatures in shallow groundwater and surface water are similar across the site. Although the 6:2 FTS and PFHxA concentrations in groundwater and surface water at the site are generally within the signature of the Ansulite sample, the higher concentrations of PFOS, PFHxS, FHxSA, and 8:2 FTS suggest that the primary source of PFAS contamination is from releases of older AFFF formulations.

The PFAS signature in the deep zone groundwater (see DEPMW-1D) appears to be unique. The concentrations of short-chain sulfonates (PFBS and PFPeS), as well as PFHxS and FBSA are much higher than those observed in shallow zone groundwater. Also, as discussed in Section 4.3.3.2, while the PFOS concentration was slightly lower, the PFOA concentration at deep monitoring well DEPMW-1D was higher than the PFOA concentration at its corresponding shallow monitoring well DEPMW-8S. The results suggest the potential for an additional upgradient source that has yet to be identified, or that the results could be indicative of a similar source with more precursors that have degraded into short-chain sulfonates. Therefore, Golder recommends installing additional deep zone monitoring wells in accessible areas north, west, and southwest of monitoring well DEPMW-1D.

5.0 QUALITY ASSURANCE/QUALITY CONTROL

Sampling was completed in accordance with applicable FDEP SOPs, project quality assurance goals were met, and the data obtained are reliable for their intended purpose. The laboratory performed method blank analyses, and accuracy and precision values were met. In addition, the following quality assurance/quality control (QA/QC) samples were collected during field activities:

- Soil and sediment sampling: 14 equipment blanks (EQB-HA-1 through EQB-HA-14) and one field reagent blank (FRB-SB-85).
- Surface water sampling: three duplicate samples (DUP-SW-4, DUP-SW-10, and DUP-SW-12), one equipment blank (EQB-PP-1), and one field reagent blank (FRB-SW-8).
- Vertical profiling and shallow monitor well installation: one duplicate sample (DUP-VP-2-20-24), two equipment blanks (EQB-Screenpoint-1 and EQB-Screenpoint-2), and two field reagent blanks (FRB-VP-1 and FRB-DEPMW-10S).
- Groundwater sampling: three duplicate samples (DUP-FSCJ-TMW-4SR, DUP-FSCJ-TMW-13S, and DUP-FSCJ-TMW-18S), two equipment blanks (EB-PP-1 and EB-PP-2), one field reagent blank (FRB-FSCJ-TMW-8S), and one trip blank.

Duplicate samples were collected immediately after collection of the primary field sample. The equipment blanks were collected by pumping (peristaltic pump) laboratory-supplied PFAS-free water through silicon and HDPE tubing into laboratory-supplied sample containers, or by pouring PFAS-free water over the sampling equipment (i.e., bucket augers, DPT drill rods, and DPT screen tooling) and collecting the water into the sample containers. Field reagent blanks consisted of PFAS-free water containerized in HDPE sample containers filled at the laboratory prior to beginning field activities. The field reagent blank sample containers were opened during the collection of a sample, and the laboratory-supplied PFAS-free water was poured directly into the sample containers and resealed. The trip blanks contained PFAS-free water provided by the laboratory and were kept in the coolers during sampling activities.

With the exception of the trip blank, each of the QA/QC samples collected were analyzed by the FDEP Central Laboratory for PFAS using DEP SOP: LC-001-3. The trip blanks were analyzed for VOCs by EPA Method 8260D. Equipment blank sample EQB-HA-13 was additionally analyzed for SVOCs using EPA 8270E, VOCs using EPA Method 8260D, and TRPH using the FL-PRO method. The analytical results for the duplicate samples were similar to the primary field sample results. No target analytes were detected in the QA/QC samples, with the exception of low-level PFAS in sample EQB-HA-8 (no PFOA or PFOS detected).

6.0 CONCLUSIONS AND RECOMMENDATIONS

In June 2021, Golder and FDEP representatives completed a site reconnaissance with relevant facility personnel from the Fire Academy of the South and FSCJ. Based on observations and discussions during site reconnaissance, Golder and the FDEP identified four areas of concern: AOC 1 (Debris Field Training Area); AOC 2 (Burn Pit Training Area); AOC 3 (Aircraft Rescue and Training Area); and AOC 4 (Maritime Fire Training Area).

Between June 2021 and March 2022, Golder collected soil samples from 115 soil borings (DEPSB-1 through DEPSB-115); 15 sediment samples (SED-1 through SED-15); 12 surface water samples (SW-1 through SW-12); and groundwater samples from three depth intervals at four vertical profiling locations (VP-1 through VP-4). Between December 2021 and March 2022, Golder oversaw the installation of 10 new shallow monitoring wells (DEPMW-1S through DEPMW-10S) and the advancement of an exploratory soil boring to 70 feet bgs to log lithology and identify zones of low and high permeability. In March 2022, Golder oversaw the installation of four new deep monitoring wells (DEPMW-1D through DEPMW-4D). In April 2022, Golder collected groundwater samples in from the new and existing monitoring wells, as well as four JEA municipal supply wells.

The results of the investigation indicated the following:

- There are likely multiple source areas located at the site. The highest PFAS concentrations in soil, sediment, surface water, and groundwater were generally observed in AOC 1 (Debris Field Training Area) and AOC 2 (Burn Pit Training Area), where fire training activities have been conducted since the early 1990s. The high concentrations of PFOS in each media suggest the historical use of Legacy PFOS AFFF in AOC 1 and AOC 2. The presence of PFOA, 8:2 FTS, 6:2 FTS, and PFHxA also suggests some historical use of Legacy Fluorotelomer AFFF.
- The soil analytical results indicate PFOA and PFOS concentrations above leachability-based PSCTLs in vadose zone soil within AOC 1 and AOC 2. The soil analytical results from samples collected north of AOC 1 and AOC 2 (DEPSB-10, DEPSB-59, DEPSB-114, and DEPSB-115) and from south of AOC 2 (DEPSB-31) were below PSCTLs.
- The soil analytical results from samples collected in AOC 3 and AOC 4 were relatively low. PFOA concentrations in soil were below the PSCTL in both areas. PFOS concentrations were slightly above the PSCTL in AOC 3 (maximum concentration of 11 µg/kg) and below the PSCTL in AOC 4.
- The sediment and surface water analytical results suggest that PFAS present in the run-off associated with fire training activities in AOC 1 and AOC 2 have entered the stormwater collection system (perimeter ditch to the south, east, and west and various catch basins) that discharges into the pond in AOC 1. The sediment and surface water analytical results east of AOC 2 (SED-11 and SW-11) and south of AOC 1 (SED-14) indicate that the impacts are not limited to the collection system. Golder is unaware if any flow in the perimeter ditch is diverted into the low-lying, wooded areas (wetlands) surrounding AOC 1 and AOC 2.
- The groundwater analytical results indicate PFOA and PFOS concentrations are present in shallow groundwater at concentrations above the PGCTLs across the site, with the exception of upgradient well MW-10S. The downgradient horizontal extent of PFOA and PFOS impacts above the PGCTLs has not been delineated in shallow groundwater. The combined PFOA/PFOS concentrations were consistently the highest in AOC 1 (shallow and deep zone) and AOC 2 (shallow zone); however, the highest concentration was observed in the sample collected from monitoring well DEPMW-6S, which is located in the southern portion of AOC 3.

- High relative concentrations of short-chain (C6 or less) carboxylates in groundwater, including PFHxA, PFPeA, and PFBA; short to long-chain sulfonates, including PFHxS, PFPeS, and PFBS; and the short-chain 6:2 FTS were reported in samples with higher PFOA and PFOS concentrations. In addition, FHxSA was also reported at high relative concentrations (e.g., FSCJ-TMW-2SR and FSCJ-TMW-3S), particularly in the vicinity of the burn pits in AOC 2.
- With the exception of deep monitoring well DEPMW-1D (AOC 1), the PFAS concentrations in deep zone groundwater were observed to be significantly less than those observed in the shallow zone groundwater.
- No PFAS were detected at concentrations above laboratory method detection limits in the JEA municipal supply wells.
- Overall, the PFAS signatures in shallow groundwater and surface water are similar across the site. Although the 6:2 FTS and PFHxA concentrations in groundwater and surface water at the site are generally within the signature of the Ansulite sample, the higher concentrations of PFOS, PFHxS, FHxSA, and 8:2 FTS suggest that the primary source of PFAS contamination is from releases of older AFFF formulations.
- The PFAS signature in the deep zone groundwater (see DEPMW-1D) appears to be unique. The concentrations of short-chain sulfonates (PFBS and PFPeS), as well as PFHxS and FBSA are much higher than those observed in shallow zone groundwater. While the PFOS concentration was slightly lower, the PFOA concentration at deep monitoring well DEPMW-1D was higher than the PFOA concentration at its corresponding shallow monitoring well DEPMW-8S. The results suggest the potential for an additional upgradient source that has yet to be identified, or that the results could be indicative of a similar source with more precursors that have degraded into short-chain sulfonates.
- Golder recommends installing additional shallow zone monitoring wells in accessible areas along the site boundary. Golder also recommends installing additional deep zone monitoring wells in accessible areas north, west, and southwest of monitoring well DEPMW-1D.
- Golder recommends collecting additional soil samples east and west of AOC 1 and AOC 2, if feasible, to determine the horizontal extent of the impacts. Golder observed that the areas east and west of AOC 1 and AOC 2 generally consist of low-lying, wooded areas (wetlands).
- Golder recommends delineating the sediment and surface water impacts at the site.
- The soil analytical results from AOC 3 and AOC 4 do not appear to correlate with the high groundwater concentrations observed in the area, particularly monitoring well DEPMW-6S. Golder recommends collecting an additional groundwater sample from DEPMW-6S to confirm the results. If confirmed, Golder recommends additional soil sampling in vicinity of DEPMW-6S.
- The PFOS concentration observed at monitoring well DEPMW-9S (3,600 ng/L) suggests an additional source area may be present near the skid pad and north of AOC 1 and AOC 2. Golder recommends additional assessment activities in the vicinity of the skid pad.
- Given the high concentrations of PFOA and PFOS in groundwater within AOC 1 and AOC 2, Golder recommends that the FDEP consider the effectiveness and feasibility of an ISR to address soil contamination present at concentrations above leachability-based PSCTLs.

Notes:
Provisional SCTL - FDEP Provisional Soil Cleanup Target Level
All results are reported in micrograms per kilogram (µg/kg)
Bold font indicates constituent concentration was reported above the laboratory method detection limit.
Highlighted font indicates constituent concentration was reported above the FDEP Provisional Soil Cleanup Target Level.
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
J - Estimated value and/or the analysis did not meet established quality control criteria.
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.

PFOA	Perfluorooctanoic acid	PFDA	Perfluorodecanoic acid
PFOS	Perfluorooctanesulfonic acid	PFDoA	Perfluorododecanoic acid
4:2 FTS	4:2 Fluorotelomer sulfonate	PFHpS	Perfluoroheptanesulfonic acid
6:2 FTS	6:2 Fluorotelomer sulfonate	PFHpA	Perfluoroheptanoic acid
8:2 FTS	8:2 Fluorotelomer sulfonate	PFHxS	Perfluorohexanesulfonic acid
HODA	Hexafluoropropylene oxide dimer acid	PFHxA	Perfluorohexanoic acid
N-Et	N-Et perfluorooctanesulfonamidoAc acid	PFNS	Perfluorononanesulfonic acid
N-Me	N-Me perfluorooctanesulfonamidoAc acid	PFNA	Perfluorononanoic acid
FBSA	Perfluoro-1-butane sulfonamide	PFPeS	Perfluoropentanesulfonic acid
FHxSA	Perfluoro-1-hexane sulfonamide	PFPeA	Perfluoropentanoic acid
FOSA	Perfluoro-1-octane sulfonamide	PFTeA	Perfluorotetradecanoic acid
PFBS	Perfluorobutanesulfonic acid	PFTriA	Perfluorotridecanoic acid
PFBA	Perfluorobutanoic acid	PFUnA	Perfluoroundecanoic acid
PFDS	Perfluorodecanesulfonic acid	PFPrS	Perfluoropropanesulfonic acid

Notes:
Provisional SCTL - FDEP Provisional Soil Cleanup Target Level
All results are reported in micrograms per kilogram (µg/kg)
Bold font indicates constituent concentration was reported above the laboratory method detection limit.
Highlighted font indicates constituent concentration was reported above the Provisional FDEP Soil Cleanup Target Level.
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.

PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctanesulfonic acid
4:2 FTS	4:2 Fluorotelomer sulfonate
6:2 FTS	6:2 Fluorotelomer sulfonate
8:2 FTS	8:2 Fluorotelomer sulfonate
HODA	Hexafluoropropylene oxide dimer acid
N-Et	N-Et perfluorooctanesulfonamidoAc acid
N-Me	N-Me perfluorooctanesulfonamidoAc acid
FBSA	Perfluoro-1-butane sulfonamide
FHxSA	Perfluoro-1-hexane sulfonamide
FOSA	Perfluoro-1-octane sulfonamide
PFBS	Perfluorobutanesulfonic acid
PFBA	Perfluorobutanoic acid
PFDS	Perfluorodecanesulfonic acid
PFDA	Perfluorodecanoic acid
PFDoA	Perfluorododecanoic acid
PFHpS	Perfluoroheptanesulfonic acid
PFHpA	Perfluoroheptanoic acid
PFHxS	Perfluorohexanesulfonic acid
PFHxA	Perfluorohexanoic acid
PFNS	Perfluorononanesulfonic acid
PFNA	Perfluorononanoic acid
PFPeS	Perfluoropentanesulfonic acid
PFPeA	Perfluoropentanoic acid
PFTeA	Perfluorotetradecanoic acid
PFTriA	Perfluorotridecanoic acid
PFUnA	Perfluoroundecanoic acid
PFPrS	Perfluoropropanesulfonic acid

Notes:
Provisional SWSL - FDEP Provisional Surface Water Screening Level
All results are reported in nanograms per liter (ng/L)
Bold font indicates constituent concentration was reported above the laboratory method detection limit.
Highlighted font indicates constituent concentration was reported above the Provisional FDEP Surface Water Screening Level for human health.
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
NM - Not Measured

Notes:

[1]Survey data provided by Banks & Banks Consulting, Inc. (June 2022)

in - inch
ft - feet
UNK - Unknown
NI - not installed

ELEV - elevation (feet)
DTW - depth to water (feet)
FP - free product (feet)
NM - not measured

Notes:
Provisional GCTL - FDEP Provisional Groundwater Cleanup Target Level
All results are reported in nanograms per liter (ng/L)
Bold font indicates constituent concentration was reported above the laboratory method detection limit.
Highlighted font indicates constituent concentration was reported above the Provisional FDEP Groundwater Cleanup Target Level.
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
J - Estimated value and/or the analysis did not meet established quality control criteria.

PFOA	Perfluorooctanoic acid	PFDA	Perfluorodecanoic acid
PFOS	Perfluorooctanesulfonic acid	PFDoA	Perfluorododecanoic acid

Notes:
Provisional GCTL - FDEP Provisional Groundwater Cleanup Target Level
All results are reported in nanograms per liter (ng/L)
Bold font indicates constituent concentration was reported above the laboratory method detection limit.
Highlighted font indicates constituent concentration was reported above the Provisional FDEP Groundwater Cleanup Target Level.
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
J - Estimated value and/or the analysis did not meet established quality control criteria.

PFOA	Perfluorooctanoic acid	PFDA	Perfluorodecanoic acid
PFOS	Perfluorooctanesulfonic acid	PFDoA	Perfluorododecanoic acid
4:2 FTS	4:2 Fluorotelomer sulfonate	PFHpS	Perfluoroheptanesulfonic acid
6:2 FTS	6:2 Fluorotelomer sulfonate	PFHpA	Perfluoroheptanoic acid
8:2 FTS	8:2 Fluorotelomer sulfonate	PFHxS	Perfluorohexanesulfonic acid
HODA	Hexafluoropropylene oxide dimer acid	PFHxA	Perfluorohexanoic acid
N-Et	N-Et perfluorooctanesulfonamidoAc acid	PFNS	Perfluorononanesulfonic acid
N-Me	N-Me perfluorooctanesulfonamidoAc acid	PFNA	Perfluorononanoic acid
FBSA	Perfluoro-1-butane sulfonamide	PFPeS	Perfluoropentanesulfonic acid
FHxSA	Perfluoro-1-hexane sulfonamide	PFPeA	Perfluoropentanoic acid
FOSA	Perfluoro-1-octane sulfonamide	PFTeA	Perfluorotetradecanoic acid
PFBS	Perfluorobutanesulfonic acid	PFTriA	Perfluorotridecanoic acid
PFBA	Perfluorobutanoic acid	PFUnA	Perfluoroundecanoic acid
PFDS	Perfluorodecanesulfonic acid	PFPrS	Perfluoropropanesulfonic acid
		ADONA	4,8-Dioxa-3H-perfluorononanoic acid

PROVISIONAL GROUND WATER CLEANUP TARGET LEVEL (GCTL)	PFOA IN ng/L	PFOS IN ng/L	SUM OF PFOA + PFOS IN ng/L
PGCTL	70	70	70

NOTE(S)

1. PROVISIONAL GCTL - FDEP PROVISIONAL GROUNDWATER CLEANUP TARGET LEVEL.
2. ALL RESULTS ARE REPORTED IN NANOGRAMS PER LITER (ng/L).
3. BOLD FONTS INDICATES CONSTITUENT CONCENTRATION WAS REPORTED ABOVE THE LABORATORY METHOD DETECTION LIMIT.
4. HIGHLIGHTED FONT INDICATES CONSTITUENT CONCENTRATION WAS REPORTED ABOVE THE PROVISIONAL GROUNDWATER CLEANUP LEVEL.
5. I- REPORTED VALUE IS BETWEEN THE LABORATORY METHOD DETECTION LIMIT AND LABORATORY PRACTICAL QUANTITATION LIMIT.
6. U - THE COMPOUND WAS ANALYZED FOR, BUT NOT DETECTED. THE REPORTED VALUE IS THE METHOD DETECTION LIMIT FOR THE SAMPLE ANALYZED.
7. ft bgs - FEET BELOW GROUND SURFACE.
8. PFOA - PERFLUORO-N-OCTANOIC ACID.
9. PFOS - PERFLUOROOCTANESULFONIC ACID.

REFERENCE(S)

1. AERIAL IMAGE TAKEN FROM FDEP BUREAU OF SURVEY AND MAPPING (LAND BOUNDARY INFORMATION SYSTEM), DATED FEBRUARY 2020.
2. PROPERTY BOUNDARY TAKEN FROM FLORIDA DEPARTMENT OF REVENUE.

APPENDIX A

Field Documentation

SOIL SAMPLE COLLECTION FORM

Project Name: Fire Academy of the South - FSCJ
Project Number: 214570834
Sampled by: Scott Neal + Kirk Fraley
Sampling Location: AOC-1

Sample ID: DEPSB-1 → DEPSB-10
Date: 11 / 15 / 2021
Type of Sampling Equipment: Hand Auger
Sampling Method: Grab

SAMPLE COLLECTION LOCATION SKETCH:

AOC-1 (DEPSB-1 through DEPSB-10)

All samples analyzed for PFAS

Depth to Groundwater: ≤2' bgs

Sample ID	Time Collected	Depth Interval	Soil Description
DEPSB-1-0.5	0940	0' - 0.5'	Dark Brn FS, M, No Odor
DEPSB-1-2.0	0945	0.5' - 2.0'	" " " "
~~DEPSB-1-2.5~~	~~0950~~	~~2.0'-4.0'~~	~~Dark gray FS, M, N.O~~
DEPSB-2-0.5	0940	0' - 0.5'	Dark Brn FS w/ debris, M, N.O
DEPSB-2-2.0	0945	0.5' - 2.0'	Dark Brn FS w/organics, M, N.O
DEPSB-2-4.0 (FW)	~~0950~~	2.0'-4.0'	~~wet~~ wet at ~2.5", no sample
DEPSB-3-0.5	1005	0' - 0.5'	Dark Brn FS, M, N.O.
DEPSB-3-2.0	1010	0.5' - 2.0'	Dark Brn FS, M, N.O.
~~DEPSB-3~~ (FW)	None	2.0'-4.0'	wet at 2.0 ft bgs
DEPSB-4-0.5	1035	0' - 0.5'	Dark Brn FS, M, N.O
(FW) DEPSB-4-1.5	1040	0.5' - ~~2.0~~ 1.5'	Brn + gray FS, M, N.O.
(FW)		2.0'-4.0'	Wet at 1.5' bgs
DEPSB-5-0.5	1045	0' - 0.5'	Dark Brn FS, M, N.O.
(FW) DEPSB-5-1.0	1050	0.5' - ~~2.0~~ 1.0	Gray FS, M, N.O
(FW)		2.0'-4.0'	Wet at 1.0' bgs
DEPSB-6-0.5	1100	0' - 0.5'	Dark Brn FS, M, N.O
DEPSB-6-1.0	1105	0.5' - ~~2.0~~ 1.0	Gray FS, M, N.O.
		2.0'-4.0'	water @ bgs
DEPSB-7-0.5	1110	0' - 0.5'	Dark Brn FS, M, N.O.
DEPSB-7-1.0	1115	0.5' - ~~2.0~~ 1.0	Gray FS, M, N.O
		2.0'-4.0'	Water @ 1.0' bgs

SUBJECT FIRE ACADEMY OF THE SOUTH-FSCJ; ~~ERIC-7421~~ (SN) ERIC-17235		
Job No. 21470834A Ref. ~~Jacksonville~~, FL	Made by Scott Neal-Golder Checked (SN) X 70°, clear Reviewed	Date 11/09/2021 Sheet 1 of 1

0755- Golder (Scott Neal) on site. Bud Connor (GeoTek) on site
0800- Meet with Jason Carpenter (Fire Academy). Discuss sow.
0815- Golder & GeoTek review HASP
0830- Mark soil/well locations using GPS.
0840- GeoTek begins scanning northern portion of AOC-2 (grid area) using EMI wand and GPR sled.
1000- Check historic pond location in far NW corner of site north of driving course. Area is holding water, but has filled with sediment & is heavily vegetated with pines, bay trees, palmettos.
1030- Photograph sample locations & utilities. Water, ~~P~~propane, & electric lines in northern portion of AOC-2
1130- Mark sample locations in southern portion of AOC-2 near burn pits.
1230-1310- lunch
1330- GeoTek begins utility location in southern portion of AOC-2. Propane, gasoline, electrical, in area. Mark locations in AOC-1
1430- Check access to sediment/surface water sampling locations. for access
1630- Pack equipment. off site
1700- Office. off job

	Reviewed	

0800 - Golder (Scott Neal) + GeoTek (Bud Connor) on site. Review HASP + SOW.
0820 - Bud Resumes scan of Burn Pit area of AOC-2. using EMI wand + GPR sled.
0825 - Speak with Fire Academy + FSCJ Personnel (Jason Carpenter + Charles Johnson) + get access to designs/as-builts of Maritime Training Area + Aircraft ~~training~~ training areas in the southern portion of the site (AOC-3 + AOC-4). Photo scan utility + drainage info. + make notes on site maps.
0900 - Bud moves to AOC-1 + begins utility scan. Photograph sample locations + utilities. Map any major underground utilities. No location moved more than ~3 feet.
1100 - Move to AOC-4 and scan proposed soil boring and well locations
1300-1400 - Lunch
1400 - Scan proposed location in AOC-3.
1415 - Mark moved locations on gps unit. Photograph locations in vicinity of marked buried utilities
1545 - Bud done scanning. Review locations
1630 - Pack vehicles
1645 - Off site
1720 - Office. off job

0845 - Leave office
0915 - On site. Check in with site personnel.
0930 - Review HASP, SOW, + PFAS SOPs.
0945 - Decon + set up sampling equipment in the northern portion of AOC-2
1000 - Begin soil sampling for analysis of PFAS. Sampling to top of water table/ vadose zone. See Soil sample Collection forms for sample times and lithologies
1200 - Equipment Blank sample EQB-HA-4 collected at 1200 from hand auger bucket
1220 - 1310 - Lunch
1310 - Resume sampling
1455 - EQB-HA-5 collected
1600 - End Sampling. Drum decon water. Secure staging area.
1645 - Golder office, off job

SN 11/22

Golder Associates

Justin Spengler, Scott Neal

0730 - Meet at Golder Jacksonville office
0805 - On site. Check in with site personnel.
0815 - Review HASP, SOW, & PFAS SOPs
0825 - Setup / Decon. Move to AOC-2
0835 - Begin Soil Sampling vadose zone for analysis of PFAS. See Soil Sample Collection Forms for lithologies & sample times.
0940 - Collect Equipment Blank sample EQB-HA-6 from hand auger bucket
1050 - Complete sampling in northern portion & outside areas of AOC-2. Set up equipment near southern Burn Pit in AOC-2
1110 - 1200 - lunch
1200 - Continue soil sampling
1335 - Collect EQB-HA-7 from hand auger bucket for PFAS
1515 - EQB-HA-8 collected from hand auger bucket for PFAS
1600 - End Sampling. Drum decon water. Clean/secure staging area.
1645 - Golder office. off job

SNeal, JSpengler

0740 - Golder office. Justin Spengler & Scott Neal Pack Truck
0800 - Calibrate YSI Multimeter and Hach Turbidimeter. See calibration log
0830 - Mob ~~to~~ site
0900 - On site. Meet with Jason (FSCJ). Set up decon area. Review HASP & PFAS SOP.
0915 - Go to creek south of JEA Easment south of AOCs 3 & 4 & begin sediment & surface water sampling. See Water Sampling forms for surface water parameters. SW samples collected using peristaltic pump & disposable tubing. Sediment samples collected after using decontaminated Stainless steel hand auger.
0935 - Collect SW-3 for PFAS
0945 - Collect SED-3 for PFAS. Gray Sandy with silt.
1005 - Collect SW-4 & duplicate sample DUP-SW-4
1025 - collect SED-4. Dark Brown silty gravel with organics
moved SED-4/SW-4 location east near outfall of wetland drainage coming south from wetland east of Fire Academy
1045 - Collect SED-13. No surface water at location to sample. Dark Brown & gray Silty Sand
1055 - Collect SED-1 at SW-1 location. Gray silty Sand & Dark Brown silty organics
1110 - Collect SED-12. No SW at location. Light gray & brown fine Sand
1125 - Collect SED-14. No SW at location. Dark Brown organic silt/muck
1140 - Collect SW-5 for PFAS
1145 - Collect SED-5 for PFAS. Black organic silt with gravel
1155 - Collect SED-2 at SW-2 location. Dark Brown coarse sand and silt.
1205 Collect SW-6 for PFAS. See Collection sheet
1210 - Collect SED-6 for PFAS. Brown Silty Sand with organics
1220 - Decon equip. Staging area.
1230 - 1325 - lunch
1335 - AOC-4 & continue SED & SW sampling
1350 - Collect SW-7 for PFAS. See Collection sheet
1400 - Collect ~~SW SED 8 for PFAS~~. SED-7 for PFAS - Dark Brown & gray silty sand
~~1407~~ SW 11/30
1410 - Collect equipment blank EQB-PP-1 through peristaltic pump, hdpe tubing, & silicon tubing
1430 - Collect FRB-SW-8 field reagent blank
1435 - Collect SW-8 for PFAS. See Collection form
1440 - Collect SED-8. Brown sandy silt with organics
1500 - SW-9 for PFAS & MS/MSD
1505 - SED-9 collected for PFAS. Dark brown organic silt and gravel
1525 - Collect SW-10 & duplicate Sample DUP-SW-10
1530 - Collect SED-10. Broad organic silt & Sand. Slight petroleum odor
1605 - Collect SW-11 for PFAS. Could not access with YSI due to location beyond fence
1608 - Collect SED-11 for PFAS. Organics with some brown silt
1620 - Unpack equip. at staging area. dump decon water into drums
1635 - off site
1710 - office. Unpack equip
1730 - off job

Daily PFAS Sampling Checklist

Date: 11/15/2021

Site Name: Fire Academy of the South - FSCJ

Weather (*temperature/precipitation*): 65°, Sunny

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- [X] No water- or stain-resistant clothing (e.g., GORE-TEX®)
- [X] During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- [X] Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- [X] Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- [X] Clothing has not been recently laundered with a fabric softener
- [X] No coated HDPE suits (e.g., coated Tyvek® suits)
- [X] Field crew has not used cosmetics, moisturizers, or other related products today
- [X] Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- [X] Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- [X] Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- [X] No materials containing Teflon™, Viton™, or fluoropolymers
- [X] No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- [X] No plastic clipboards, binders, or spiral hard cover notebooks
- [X] No waterproof field books
- [X] No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- [X] No chemical (blue) ice, unless it is contained in a sealed bag
- [X] No aluminum foil
- [X] No sticky notes (e.g., certain Post-It® products)

Decontamination:

- [X] Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- [X] "PFAS-free" water is on-site for decontamination of field equipment
- [X] Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- [x] No food or drink on-site, except within staging area
- [ ] Food in staging area is contained in HDPE or stainless steel container

Acceptable calibration check is if the meter reads within +/- 0.3 mg/L of the value of appropriate calibration standard. Need to record DO readings in mg/L and use Table FS 2200-2 "Dissolved Oxygen Saturation". ORP calibration reading must be within +/- 10 mV from the theoretical redox standard value at that temperature.

"Loc. of Preparation" indicates the transfer of solutions from manufacturers' containers to GAI containers for field use, except where otherwise noted.
No solutions are mixed or created at Golder.
"Preparation Date" is typically 1 - 3 days prior to scheduled activity, except in the case of thermometer calibration check.
ORP solution will yield more calibrations if kept clean and it requires less than 50 mL to perform a calibration check.
NIST Thermometer: Serial # 2401, Product # 1005, Inscription: ERTCO, Scale range: -1 to 101 C, Total Immersion, Scale division: 0.1

Developed with peristaltic pump and 3/8-inch hdpe tubing

SUBJECT Fire Academy of the South - FSCJ; ERIC_7421		
~~Job No.~~ 70°, cloudy Ref. SNeal, FDEPSIS	Made by Scott Neal ~~Checked~~ ~~Reviewed~~ Jacksonville, FL	Date 12/13/21 Sheet 1 of 1

1030 - Pack equipment at Golder Jacksonville, FL office
1100 - leave Golder office
1130 - On site. Check-in with Jason (FSCJ)
1145 - Jeff N. & Dennis on site from Tallahassee, FL
1230 - Bobby, John, & Justin on site with GeoProbe 6600 truck-mounted drill rig
1235 - Review S.O.W., HASP, & PFAS SOPs with FDEP & Jason (FSCJ)
1255 - Bobby & Justin construct decon pit
1255 - Set up drill rig on HPT-2 / VP-2 location in northern portion of AOC-2.
1310 - Set up Hydraulic profiling Tool equipment (GeoProbe K6300 Flow Module & GeoProbe FI6000), Calibrate HPT sensors
1400 - Begin HPT activities (See FDEP logs) to identify vertical profiling intervals
NOTES: Low-Permeability from ~11' to 15' bgs
Low-Permeability ~47'
" " ~52'-65', 65'-End Point

Proposed VP intervals: ~~28-33~~ (SN) 33-37', ~~48-52~~, 64-68, 43-47, 50-54'
1530 - Break down equipment and move to ~~HPT-2~~ HPT-1 (SN) in AOC-1
1550 - Start ~~HPT-2~~ HPT-1 (SN)
NOTES: • Low permeability layers 6-8', 10-12', 15-16', 20', 50'-51'
End point @ 53' bgs
Proposed intervals: ~~33-37'~~, 38-42', 46-50', 26-30', 50'+ if possible
1645 - Remove tooling & pack equipment
1705 - off site
1740 - office

(SN)

SUBJECT Fire Academy of the South - FSCJ; ERIC-7421		
Job No. Ref. Scott Neal & FDEP SIS	Made by Scott Neal (Golder) Checked Reviewed Jacksonville, FL	Date 12/14/2021 Sheet 1 of 1

70°, calm, cloudy

0800 - On site. FDEP SIS (Jeff, Dennis, Justin, Bobby, John) on site. Review HASP & SOW

0830 - Set up ~~track~~ (SW) Truck-mounted Geoprobe 6600 on HPT-3 in AOC-3. Moved to edge of asphalt pavement due to inaccessability of proposed location across drainage swale

0845 - Advance HPT-3. NOTES:
- Low Permeability at ~~5' bgs~~ (SW) 7', 11', 46-48, 54-56
- HPT Pressure sensor suspected broken at ~14'
- Conductivity shows clay at ~26'. Started working again at ~45'
- " " " 54-56',
- stopped HPT @ ~63'

Proposed intervals: 53-57', 36-40', 20-24', Refusal

0955 - Remove tooling and move to HPT-4 in AOC-4

1010 - Set up on HPT-4 with DPT rig. NOTES:
- Low conductivity 11-16' bgs. High conductivity 38-48' (clay)
- Pressure log not reliable
- Hardpan suspected site wide @ ~11-15'. Clay unit suspected ~38'-48'

33-37', 48-52, 20-24', Refusal

1130 - Remove tooling. Difficulty pulling through hardpan near surface

1200 - 1250 - lunch. ~~Karli & Nicki~~ Karli & Nicki (FDEP) on site

1255 - Set up on VP-3 in AOC-3 (HPT-3 location)

1300 - Push stainless steel 2" rods to 24' bgs. Expose 4' slotted screen for vertical profile sampling. Pump with peristaltic pump & disposable 3/8" HDPE tubing.

1335 - Sample VP-3-20-24 for PFAS. ~~-g~~ (SW) ~ gallons pumped

1345 - Difficulty removing tooling through hardpan. FDEP moves to shallow well installation.

1355 - Push 2 1/2" rods to 12' bgs & install DEPMW-3S at VP-3/HPT-3 location. See well installation Log. 4.2' dtw. ~~0.07~~ (SW) 0.75"

1420 - Push 2 1/2" rods to 12' bgs & install DEPMW-6S. 0.75" prepack. See Monitoring Well installation log. * Slight Petroleum/sulfur smell at ~3' in soil

1450 - Push 2 1/2" rods to 12' bgs at DEPMW-7S in AOC-3. SEE Monitoring Well installation Log.

1510 - Decon Drill rods/tooling

1535 - Set up rig on DEPMW-2S in AOC-2. See Monitoring well Installation Log.

1555 - Karli & Nicki off site. Setup on & install shallow monitoring well DEPMW-8S in AOC-1. See Monitoring Well Installation Log. * Well pulled up during installation. TD: 10 ft. SI: 0'-10' bgs

1615 - Decon tooling; All off site

1705 - offsite

(SW)

SUBJECT Fire Academy of the South; FSCJ		
Job No. FDEP-SIS Ref. Scott Neal - Golder	Made by Scott Neal (Golder) ~~Checked~~ SN ~~Reviewed~~ Jacksonville, FL	Date 12/15/2021 Sheet 1 of 1

67°, clear, calm → 77° clear, calm

0755 - On site. FDEP-SIS (Justin, Bobby, John) on site. Review HASP, SOW, PFAS SOPs
0810 - Move GeoProbe 6600 Truck-mounted rig to Proposed DEPMW-5S shallow monitoring well location in AOC-1. Hand Auger to 5 ft bgs to clear utilities
0816 - Push 2 1/2" rods to 12' bgs and install 0.75" prepack screen well. See Monitoring well installation Log. DEPMW-5S
0840 - Move to DEPMW-1S in AOC-1 and install 0.75-inch prepack screen shallow monitoring well to 12' bgs. See Monitoring well installation log.
0905 - DECON tooling
0930 - Move to DEPMW-4S in AOC-4 and install 12' shallow monitoring well ~~to~~ SN with 0.75-inch prepack screen. See Monitoring well installation log.
*0910 - Jeff & Dennis (FDEP) on site with sand and concrete for wells and well pads. Begin ~~pour~~ SN building 2'x2' concrete pads for wells.
0945 - Matt Crews (Golder) on site. Review HASP
0950 - Collect soil sample DEPSB-111-0.5 for PFAS @ DEPMW-4S location. See Soil Sample form
0955 - " " " DEPSB-111-2.0 " "
1000 - " " " DEPSB-111-3.5 " "
1020 - Collect SED-8. Previous sample lost in Shipping Process.
1045 - Break concrete at DEPSB-112 and DEPSB-113 locations in AOC-2
1055 - Collect soil sample DEPSB-112-0.5 for PFAS. See Soil Sample Collection form.
1100 - " " " DEPSB-112-2.0 " "
1110 - " " " DEPSB-113-0.5 " "
1115 - " " " DEPSB-113-2.0 " "
1115 - Matt Crews off site
1125 - Move to HPT-3/DEPMW-3S location & advance GeoProbe soil sleeve to ft bgs to retrieve core of suspected hardpan that is present approximately 4' thick near 10' bgs throughout site

DEPMW-4S

Cell: 850 508-7712

Hydraulic Conductivity (K) in feet oer day at two different locations at FAOS, The hardpan we encountered is an impermeable zone. We set our shallow wells screened from 2 to 12 feet BLS with the screen penetrating into the hardpan and catching the transition from High K to Low K and hopefully at this transition the majority of the PFAS. We may set intermediate depths at 45 feet BLS to catch the second transition from High to Low K. Dave Meyers suggest screen-points as well.

Daily PFAS Sampling Checklist

Date: 12/13/2021

Site Name: ERIC_17235 - Fire Academy of the South - FSCJ

Weather (*temperature/precipitation*): 70°, cloudy

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- [x] No water- or stain-resistant clothing (e.g., GORE-TEX®)
- [x] During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- [x] Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- [x] Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- [x] Clothing has not been recently laundered with a fabric softener
- [x] No coated HDPE suits (e.g., coated Tyvek® suits)
- [x] Field crew has not used cosmetics, moisturizers, or other related products today
- [x] Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- [x] Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- [x] Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- [x] No materials containing Teflon™, Viton™, or fluoropolymers
- [x] No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- [x] No plastic clipboards, binders, or spiral hard cover notebooks
- [x] No waterproof field books
- [x] No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- [x] No chemical (blue) ice, unless it is contained in a sealed bag
- [x] No aluminum foil
- [x] No sticky notes (e.g., certain Post-It® products)

Decontamination:

- [x] Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- [x] "PFAS-free" water is on-site for decontamination of field equipment
- [x] Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- [x] No food or drink on-site, except within staging area
- [x] Food in staging area is contained in HDPE or stainless steel container

Notes:

Site orientation + Review SOPs w/ drillers.

Water used for drilling/decon tested + is PFAS-free

0925 - Review HASP + PFAS SOPs.
0935 - Set up decon pit + decon dpt tooling
1105 - Collect Equipment blank sample EQB-Screenpoint-2 from decontaminated well screenpoint
1110 - Bobby (FDEP) on site
1115 - Decon complete. Move to AOC-3, VP-3 vertical profile location. Hand clear utilities to 5 ft bgs
1130 - Push rods to 24' bgs.
1205 - Begin pumping water from decontaminated stainless steel screenpoint screened 20-24 ft bgs
1220 - Collect water sample VP-3-20-24 for PFAS. >1000 NTUs, 2 gal purged. 3rd bottle collected for turbidity
1230 - Push to 36-40 ft bgs with decontaminated sampling point
1245 - Collect VP-3-36-40 for PFAS. 3 gal pumped. >1000 ntus. 3rd bottle collected for high turbidity
1300 - Push to 52 ft bgs. Tube with hdpe tubing (All samples use hdpe + new silicon masterflex with peristaltic pump). Clean screenpoint 48-52 ft bgs interval. Begin pumping
1325 - Collect VP-3-48-52 for PFAS. >1000 ntus. ~~2.5~~ 3.0 (SW) gal pumped. 3rd bottle collected.
1330 - Remove tooling. Move to staging area to decon DPT tooling

(SW) * 1400 Demarcus off site for day

1420 - Move rig south of skid pad to DEPMW-9S location.
1445 - Collect Equipment blank sample EQB-HA-1 from hand Auger for PFAS analysis
1450 - Collect DEP SB-114-0.5 from 0-0.5 ft bgs for PFAS
1452 " DEPSB-114-2.0 from 0.5-2.0 ft bgs for PFAS
1455 - " DEPSB-114-2.5 from 2.0-2.5 ft bgs for PFAS

DEPSB-114	(DEPMW-9S location)
0-0.5'	Dark brown fine sand and organics, Moist, N.O.
0.5-2.0'	Light tan + gray fine sand, Moist, No odor
2.0-2.5'	Light Gray fine sand, Moist → wet, No odor, water table ~2.5' bgs

1458 - Push 2.25" diameter rods to 12' bgs + construct shallow well. 0.75" riser * prepack screen. Screen interval 2-12 ft bgs. Annulus filled with 20/30 sand to 0.5 ft bgs, grout to surface
1530 - Construct 2'x2' pad w/ 8" bolt-down manhole
1555 - Bobby stays at DEPMW-9S for well development. Move rig to DEPMW-10S south of driver training course.

(SW)

Golder Associates

SUBJECT Fire Academy of the South - FSCJ; ERIC_17235		
Job No.	Made by Scott Neal - WSP/ Golder	Date 3/7/2022
Ref. 87°, cloudy, calm	Checked ~~Golder~~ Reviewed ~~FDEP - Bobby W.~~ JAEE - Robby C.	Sheet 2 of 2

1615 - Hand Auger to 5 ft bgs to clear utilities at DEPMW-10S and collect soil samples
-DEPSB-115 (DEPMW-10S location)
0-0.5 ft bgs Dark Brown silty sand, dry, no odor
0.5-2.0 ft bgs Dark brown & dark gray fine sand, no odor, Moist
2.0-4.0 ft bgs Dark gray fine sand, moist, no odor
A at 6.0' bgs
1620 - Collect DEPSB-115-0.5 for PFAS, 0'-0.5' bgs
1622 - " DEPSB-115-2.0 " " , 0.5'-2.0' bgs
1625 - " DEPSB-115-4.0 " " , 2.0'-4.0' bgs
1630 - Construct DEPMW-10S (same construction as DEPMW-9S)
1635 - Collect Field Reagent Blank sample FRB-DEPMW-10S for PFAS
1650 - JAEE Packed & off site. Pad & development for 3/8
1700 - DEPMW-9S developed. ~18 gal & <140 mtns
1705 - Bobby & Golder off site
1740 - Office - off Job

Golder Associates

SUBJECT Fire Academy of the South - FSCJ ; ERIC - 17235		
Job No.	Made by Scott Neal	Date 3/8/2022
~~Ref.~~ 75°, cloudy, calm	Checked Golder/WSP	Sheet 1 of 1
	Reviewed	

0710 - Golder office. Calibrate YSI meter (See Cal Log) & Pack truck
0740 - Leave Golder/WSP office in Enterprise Rental F-150
0805 - On site. Bobby (FDEP) on site. Develop DEPMW-10S. Slow purge with dark brown, stained water
0830 - JAEE on site. Set up rig on VP-4 in AOC-4
0850 - Collect surface water sample SW-12 and Duplicate Sample DUP-SW-12 from pond in Northwest corner of site north of driver training course. Suspended detritus and duck weed cover on pond. See Sample form
0900 - Collect sediment sample SED-15 from SW-12 location
0905 - Move to AOC-4 and review HASP & PFAS SOPs
0915 - Push decontaminated rods to 24 ft bgs. HDPE tubing into decontaminated stainless steel screen 20-24 ft bgs
0930 - Begin pumping
0945 - Collect water sample VP-4-20-24 for PFAS @ ~~1000~~ 500 ntus. 3rd bottle collected
1000 - Begin pumping in 36-40' bgs interval
1015 - Collect VP-4-36-40 water sample. 3 bottles. ~~>1000 ntus~~ @ 990, ~3 gal purged, 990 ntus
1033 - Begin pumping at 48'-52' bgs interval
1048 - Collect VP-4-48-52 with MS/MSD (6 bottles total), ~3 gal, >1000 ntus
1100 - To Staging area to decon tooling
1135 - Move to AOC-1 and push to 24' bgs with decontaminated rods. Hand clear to 5' bgs
1150 - Begin pumping through hdpe tubing, peristaltic pump, & decontaminated stainless steel screenpoint in 20'-24' bgs interval. JAEE off site for lunch
1220 - Collect VP-1-20-24 for PFAS. 790 ntus, 4 gal Purged, 3 bottles
1230 - Collect Field Reagent Blank sample FRB-VP-1 next to rig for PFAS
1245 - JAEE on site. Push decontaminate screen to 36-40 ft bgs interval
1315 - Collect VP-1-36-40 for PFAS. 620 ntus, 2.5 gal purged
1318 - Push clean screenpoint to 48-52 ft bgs interval
1350 @ ~~1345~~ Collect VP-1-48-52 for PFAS. gal purged. ntus
1355 - Pack rig. Move to staging Area & decon tooling with Steam cleaner, brushes, etc
1435 - Move to VP-2 location in AOC-2.
1440 - Hand clear utilities to 5-ft bgs. Push decontaminated stainless steel screenpoint to 24 ft bgs
1450 - Begin pumping
1508 - Collect VP-2-20-24 and DUP-2-20-24 for PFAS. @ ~~2~~ 2.5 gal. pumped. 920 NTUs
1535 - Collect VP-2-36-40 for PFAS, 2.5 gal pumped. >1000 NTUs
1618 - Collect VP-2-48-52 for PFAS 2.5 gal, >1000 ntus
1630 - Relenquish sample cooler to Bobby Williams to deliver to FDEP Lab, Tallahassee, FL
1640 - Bobby off site. Pack staging area. drum all decon/development water - 1 55-gal drum IDW water
1710 - 2'x2' concrete pad & 8" bolt-down manhole at DEPMW-10S
1740 - Patch VP-4 hole in pavement.
1750 - All cleaned, secured, & packed. All off site
1845 - Golder/WSP office. Off Job. Equip unpacked. Post Cal YSI. - See log

@ 3/8/22

Acceptable calibration check is if the meter reads within +/- 0.3 mg/L of the value of appropriate calibration standard. Need to record DO readings in mg/L and use Table FS 2200-2 "Dissolved Oxygen Saturation". ORP calibration reading must be within +/- 10 mV from the theoretical redox standard value at that temperature.

"Loc. of Preparation" indicates the transfer of solutions from manufacturers' containers to GAI containers for field use, except where otherwise noted.
No solutions are mixed or created at Golder.
"Preparation Date" is typically 1 - 3 days prior to scheduled activity, except in the case of thermometer calibration check.
ORP solution will yield more calibrations if kept clean and it requires less than 50 mL to perform a calibration check.
NIST Thermometer. Serial # 2401, Product # 1005, Inscription: ERTCO, Scale range: -1 to 101 C, Total Immersion, Scale division: 0.1

Daily PFAS Sampling Checklist

Date: 3/8/2022

Site Name: ERIC_17235; Fire Academy of the South

Weather (*temperature/precipitation*): 75°, cloudy, calm

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- [x] No water- or stain-resistant clothing (e.g., GORE-TEX®)
- [x] During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- [x] Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- [x] Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber

Daily PFAS Sampling Checklist

Date: 3/14/2022

Site Name: Fire Academy of the South - FSCJ, ERIC_17235

Weather (*temperature/precipitation*): 68°, cloudy

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- ☒ No water- or stain-resistant clothing (e.g., GORE-TEX®)
- ☒ During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- ☒ Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- ☒ Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- ☒ Clothing has not been recently laundered with a fabric softener
- ☒ No coated HDPE suits (e.g., coated Tyvek® suits)
- ☒ Field crew has not used cosmetics, moisturizers, or other related products today
- ☒ Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- ☒ Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- ☒ Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- ☒ No materials containing Teflon™, Viton™, or fluoropolymers
- ☒ No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- ☒ No plastic clipboards, binders, or spiral hard cover notebooks
- ☒ No waterproof field books
- ☒ No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- ☒ No chemical (blue) ice, unless it is contained in a sealed bag
- ☒ No aluminum foil
- ☒ No sticky notes (e.g., certain Post-It® products)

Decontamination:

- ☒ Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- ☒ "PFAS-free" water is on-site for decontamination of field equipment
- ☒ Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- ☒ No food or drink on-site, except within staging area
- ☒ Food in staging area is contained in HDPE or stainless steel container

Notes:

Decon Pit, steam cleaner, + all other PFAS SOPs for drilling reviewed + followed

Date: 3/15/22

Site Name: Fire Academy of the South - FSCJ ; ERIC. 17235

Weather (*temperature/precipitation*): 67°, cloudy - Rain in afternoon (SDV)

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- ☒ No water- or stain-resistant clothing (e.g., GORE-TEX®)
- ☒ During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- ☒ Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- ☒ Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- ☒ Clothing has not been recently laundered with a fabric softener
- ☒ No coated HDPE suits (e.g., coated Tyvek® suits)
- ☒ Field crew has not used cosmetics, moisturizers, or other related products today
- ☒ Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- ☒ Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- ☒ Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- ☒ No materials containing Teflon™, Viton™, or fluoropolymers
- ☒ No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- ☒ No plastic clipboards, binders, or spiral hard cover notebooks
- ☒ No waterproof field books
- ☒ No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- ☒ No chemical (blue) ice, unless it is contained in a sealed bag
- ☒ No aluminum foil
- ☒ No sticky notes (e.g., certain Post-It® products)

Decontamination:

- ☒ Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- ☒ "PFAS-free" water is on-site for decontamination of field equipment
- ☒ Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- [x] No food or drink on-site, except within staging area
- [x] Food in staging area is contained in HDPE or stainless steel container

Acceptable calibration check is if the meter reads within +/- 0.3 mg/L of the value of appropriate calibration standard. Need to record DO readings in mg/L and use Table FS 2200-2 "Dissolved Oxygen Saturation". ORP calibration reading must be within +/- 10 mV from the theoretical redox standard value at that temperature.

Calibration values for turbidity needs to be within 10% of the standard for values between 0.1-10 NTU; 8% for values between 11-40 NTU; 6.5% for values between 41-100 NTU and 5% for values >100 NTU.

Daily PFAS Sampling Checklist

Date: 4/4/22

Site Name: FIRE ACADEMY OF THE SOUTH

Weather (*temperature/precipitation*): 80° F / SUN

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- ☑ No water- or stain-resistant clothing (e.g., GORE-TEX®)
- ☑ During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- ☑ Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- ☑ Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- ☑ Clothing has not been recently laundered with a fabric softener
- ☑ No coated HDPE suits (e.g., coated Tyvek® suits)
- ☑ Field crew has not used cosmetics, moisturizers, or other related products today
- ☑ Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- ☑ Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- ☑ Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- ☑ No materials containing Teflon™, Viton™, or fluoropolymers
- ☑ No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- ☑ No plastic clipboards, binders, or spiral hard cover notebooks
- ☑ No waterproof field books
- ☑ No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- ☑ No chemical (blue) ice, unless it is contained in a sealed bag
- ☑ No aluminum foil
- ☑ No sticky notes (e.g., certain Post-It® products)

Decontamination:

- ☑ Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- ☑ "PFAS-free" water is on-site for decontamination of field equipment
- ☑ Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- [x] No food or drink on-site, except within staging area
- [x] Food in staging area is contained in HDPE or stainless steel container

- ☑ No chemical (blue) ice, unless it is contained in a sealed bag
- ☑ No aluminum foil
- ☑ No sticky notes (e.g., certain Post-It® products)

Decontamination:

- ☑ Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- ☑ "PFAS-free" water is on-site for decontamination of field equipment
- ☑ Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- ☑ No food or drink on-site, except within staging area
- ☑ Food in staging area is contained in HDPE or stainless steel container

Notes:

Date/Time: 4/5/22 0830

Daily PFAS Sampling Checklist

Date: 4/6/22

Site Name: FIRE ACADEMY OF THE SOUTH

Weather (*temperature/precipitation*): 80° F SW

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

Field Clothing and PPE:

- ☑ No water- or stain-resistant clothing (e.g., GORE-TEX®)
- ☑ During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- ☑ Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- ☑ Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- ☑ Clothing has not been recently laundered with a fabric softener
- ☑ No coated HDPE suits (e.g., coated Tyvek® suits)
- ☑ Field crew has not used cosmetics, moisturizers, or other related products today
- ☑ Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

Field Equipment:

- ☑ Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- ☑ Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- ☑ No materials containing Teflon™, Viton™, or fluoropolymers
- ☑ No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- ☑ No plastic clipboards, binders, or spiral hard cover notebooks
- ☑ No waterproof field books
- ☑ No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- ☑ No chemical (blue) ice, unless it is contained in a sealed bag
- ☑ No aluminum foil
- ☑ No sticky notes (e.g., certain Post-It® products)

Decontamination:

- ☑ Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- ☑ "PFAS-free" water is on-site for decontamination of field equipment
- ☑ Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- ☑ No food or drink on-site, except within staging area
- ☑ Food in staging area is contained in HDPE or stainless steel container
