## 1. INTRODUCTION

### 1.1 Overview

Geosyntec Consultants, Inc. (Geosyntec) has prepared this Site Assessment Report for the Palm Beach State College (PBSC; “the Site”) located at 4200 South Congress Avenue in Lake Worth, Florida on behalf of the Florida Department of Environmental Protection (FDEP). This work was conducted in accordance with Task Assignments HW550-SL-0A032 and HW550-SOL-0A067.

### 1.2 Objectives

The objectives of this investigation were to evaluate the extent of per- and polyfluoroalkyl substances (PFAS) in Site media including soil and groundwater and the presence or absence of PFAS in sediment and surface water.

### 1.3 PFAS Overview

The Interstate Technology and Regulatory Council (ITRC) has developed a series of fact sheets to summarize the latest science and emerging technologies for PFAS. According to the ITRC fact sheets, PFAS consist of more than 4,700 manmade fluorinated organic chemical compounds that have been extensively manufactured since the mid-20th century (ITRC, 2020). Perfluorooctane sulfonate (PFOS) and perfluorooctanoate (PFOA) are two perfluoroalkyl substances that are fully fluorinated carbon-chain molecules (USEPA, 2017). Polyfluoroalkyl substances are not fully fluorinated and have a non-fluorine atom attached to at least one of the carbon atoms (ATSDR, 2017). PFAS are widely used due to their unique physical and chemical properties (e.g., surfactant, oil-repelling, water-repelling, etc.) (ITRC, 2020; USEPA, 2017). One widely recognized use of PFAS is as a component in aqueous film forming foam (AFFF) (USEPA, 2017). AFFF has been stored and used by the military, airports, and other firefighting and fire-training facilities to extinguish hydrocarbon fires (ITRC, 2020; USEPA, 2017). PFAS are emerging environmental contaminants of concern due to evidence of their potential human health effects or environmental risks. When released to the environment, some PFAS have been shown to be stable, mobile, persistent, and bioaccumulative (ITRC 2020; USEPA 2017).

### 1.4 Assessment Overview

In August 2019, Geosyntec completed a Preliminary Assessment at PBSC (Task Assignment HW550-SL-0A032) that included soil, groundwater, surface water, and sediment sampling to assess the presence or absence of PFAS in Site media (Geosyntec, 2019). Results indicated that concentrations of PFOA and/or PFOS were detected above FDEP’s provisional cleanup target levels (CTLs) in soil and groundwater (see Section 1.5 regarding provisional CTLs). Based on these results, additional site assessment activities were completed between February and March 2020 (Task Assignment HW550-SOL-0A067) to evaluate the extent of PFAS in soil and groundwater. This report presents assessment activities and results from the August 2019 and February to March 2020 assessments.

Prior to both assessment investigations, Geosyntec prepared work plans that described the proposed sampling activities for FDEP review. The Preliminary Assessment and Site Assessment Work Plans included figures showing the proposed sampling locations and tables summarizing the sampling locations, matrices, depth intervals, sampling methods, laboratory analyses, rationale, and screening criteria.

## 1.5 Laboratory Analysis and Data Screening Process

On-Site samples collected from environmental media (groundwater, sediment, soil, and surface water) and firefighting foam product were packed on wet ice and transported under chain-of-custody to the FDEP Laboratory. The laboratory analyzed the samples for PFAS constituents using United States Environmental Protection Agency (USEPA) Method 8321B.

CTLs for PFAS constituents have not been promulgated under Chapter 62-777, Florida Administrative Code (FAC). Following the procedures promulgated in Chapter 62-777 FAC, Chapter 62-780 FAC, and at the request of FDEP, the University of Florida (UF) calculated provisional soil cleanup target levels (SCTLs) for residential-direct exposure (R-), commercial/industrial-direct exposure (I-), and provisional groundwater leachability (L-) SCTLs for PFOA and PFOS. Following the promulgated procedures, UF also calculated provisional groundwater cleanup target levels (GCTLs) for PFOA and PFOS. The formulas, assumptions, and chemical-specific parameters used in the calculations are presented in letters prepared by UF included in **Appendix A**. The following table summarizes the provisional cleanup target levels.

Provisional Cleanup Target Level	PFOS	PFOA	PFOS + PFOA	Units*
R-SCTL	1,300	1,300	Not applicable	µg/Kg
I-SCTL	25,000	25,000	Not applicable	µg/Kg
L-SCTL	7	2	Not applicable	µg/Kg
Groundwater	70	70	70	ng/L

\* µg /Kg indicates micrograms per kilogram and ng/L indicates nanograms per liter.

The provisional CTLs were used as the primary screening criteria to evaluate the nature and extent of PFAS constituents in soil and groundwater. The analytical results of the media sampled at PBSC were evaluated to identify PFAS constituents present at concentrations that exceed applicable screening criteria and assess areas of the Site that may require further investigation. For general Site characterization, both soil and groundwater were screened against human health criteria. Soil data were compared to the provisional L-, R-, and I-SCTLs, and groundwater data were compared to the provisional GCTLs. Provisional CTLs for surface water are under development, and provisional CTLs for sediment have not been calculated. Therefore, the analytical results from these media were evaluated to identify potential exposure pathways and/or potential PFAS sources.

## 2. SITE DESCRIPTION AND HISTORY

### 2.1 Site Location

The Site is on the Lake Worth campus of PBSC located at 4200 South Congress Avenue in Lake Worth, Palm Beach County, Florida. The Site lies within Section 29, Township 44 South, and Range 43 East and encompasses approximately 114 acres. Within the 114-acre campus, the smaller footprint of the environmental assessment area includes a burn tower, burn building, building for fire truck and engine storage, retention pond, canal, and prop storage area. The remainder of the campus is occupied by additional buildings, parking areas, and sports fields that are associated with other PBSC academic and student-life programs unrelated to the firefighter academy program. The Site is bordered to the north, south, and west by commercial storefronts and offices. Lake Osborne and the John Prince Park (owned by Palm Beach County) border the eastern boundary of the Site. The United States Geological Survey topographic map showing the Site location is provided as **Figure 1**. The Site Vicinity Map is presented in **Figure 2**.

### 2.2 Site Utilities

Multiple underground utility types including potable water, wastewater, and stormwater pipes and electrical, natural gas, propane, and telecommunication lines are located within the area of environmental assessment activities at the Site. The Site is served by a municipal water-supply system for facility drinking water. As-built figures depicting the master utility locations within the area of assessment activities are provided in **Appendix B**.

### 2.3 Topography and Drainage

The topography of the Site is generally flat with an elevation of approximately 10 feet (ft) above mean sea level (**Figure 1**). Stormwater retention areas form surface depressions at five areas on-Site.

The Site Vicinity Map (**Figure 2**) depicts five stormwater retention areas within the property boundaries that serve to collect and store stormwater year-round across the Site. The stormwater retention areas appear to be designed to collect stormwater runoff from the parking areas and other impervious surfaces that occupy a significant portion of the land area on-Site. Storm drains are located across the Site and appear to convey stormwater runoff to the retention areas (see Sheet D-4 of **Appendix B**). Additionally, a canal (E-4 Canal) borders the southern and eastern property boundary that presumably conveys stormwater runoff from the Site (and nearby properties or roadways) to the northernmost extent of Lake Osborne (directly east of the Site). Lake Osborne extends south of the Site and is approximately 378 acres in size with an average depth of 6.8 ft and a maximum depth of 27 ft (Palm Beach County, 2020).

### 2.4 Potable Water Wells

A potable well desktop survey was conducted, within a 1-mile radius of the Site, through the Florida Department of Health (FDOH) website (FDOH, 2020). A total of nine potable wells (two labelled as “inactive”) were identified within a 0.5-mile radius and 24 potable wells (two labelled

as “inactive”) were identified between a 0.5- and 1-mile radius from the Site. **Figure 3** depicts the potable wells identified within a 1-mile radius of the Site. **Table 1** includes detailed information of the potable wells collected from the FDOH website.

## **2.5 Operational Description**

According to the PBSC website, the facility offers training for students seeking state certification as firefighters as well as current firefighters seeking to advance fire service areas including tactics and strategies, fire prevention, fire investigation, company officer, and fire apparatuses and equipment (PBSC, 2020a). An on-Site fire training tower and burn building are used to create training simulations (PBSC, 2020b). According to the Fire Training Facility Questionnaire administered by the FDEP in 2019 and completed by PBSC representatives, the facility has used AFFF since 2006 on both pervious and impervious surfaces.

## **2.6 Previous Investigations**

According to the FDEP Information Portal website, no known environmental investigations for PFAS or other constituents of concern have been previously conducted or reported to the FDEP for the Site (FDEP, 2020). Assessment activities conducted by Geosyntec in August 2019 and February to March 2020 mark the initial environmental investigations at the Site.

### 3. GEOLOGY AND HYDROGEOLOGY

#### 3.1 Regional Geology

Geologic formations underlying the region include, in descending order (Harvey et al., 2002):

- The Pamlico Sand, consisting of a fine quartz sand and carbonate grains that lies unconformably upon the Miami, Fort Thompson, and Anastasia formations;
- The Anastasia Formation that is a grainstone and composed of cemented shell fragments, commonly referred to as coquina;
- The Caloosahatchee Marl that is composed of sandy marl, clay, and silt and is interbedded with shell beds; and
- The Hawthorn Group that consists of phosphatic siliciclastic sediments of fine- to coarse-grained quartz sand, quartz silt, and clay minerals consisting of impermeable and semi-permeable marls.

Palm Beach County is primarily underlain by the Anastasia Formation that is comprised of interbedded sands and coquina-rich limestones. Sediments can vary from unconsolidated, unfossiliferous to very fossiliferous sand to moderately indurated, coquina (Scott, 2001). The Site lies at the northern extremity of the Atlantic Coastal Ridge subdivision of the Southern Geomorphologic Zone of Florida. Soils on the coastal ridge are deep and excessively drained and typically consist of shelly sands, which formed in thick beds of sandy marine sediments (White, 1970).

#### 3.2 Regional Hydrogeology

Two aquifers are present in Palm Beach County: the unconfined, surficial aquifer and the artesian Floridan Aquifer. The surficial aquifer is unconfined with a thickness of approximately 250 ft and is comprised of permeable sands, limestone, and shell beds of the Pamlico Sand, Anastasia Formation, and the Caloosahatchee Marl (Miller, 1988). The surficial aquifer is separated from the underlying Floridan Aquifer by the confining beds of the Tamiami and Hawthorn Formations that consist of several hundred feet of relatively impermeable clays, silts, and marls (Lane, 1980). In the vicinity of the Site, the Floridan Aquifer is separated from the surficial aquifer by a confining unit and is not considered a potable water source in this area due to brackish conditions.

#### 3.3 Site-Specific Geology

Geosyntec documented lithology from each soil boring and monitoring well locations (see Sections 4.2 and 4.3 and **Appendix C**). In addition to hand auger soil borings advanced for shallow soil sampling, deeper soil borings were advanced using the rotosonic technique for lithologic observations during monitoring well installation. The deepest soil boring was collected to a depth of 143 feet below land surface (ft BLS) at DEPMW-10.

Lithology from shallow hand auger soil sample locations generally consisted of light- to dark-brown, very fine-grained sand with minor amounts of silt, clay nodules, and roots (near land

surface). Lithology at DEPMW-10 was similar to the shallow borings and consisted mostly of sand with varying degrees of silt content. Cross sections representing the generalized lithology at the Site are presented on **Figure 4** and **Figure 5**.

Additionally, Geosyntec documented lithology from each sediment boring location (See Section 4.5 and **Appendix C**). Lithology collected from the sediment samples varied by location. The stormwater retention pond samples (Sed-1 and Sed-7) consisted of saturated, tan- to dark-brown, very fine-grained sand. The canal sample (Sed-2) consisted of saturated, medium-brown, very fine-grained sand with gravel up to 1-inch in diameter. The storm drain samples (Sed-3 through Sed-6) consisted of medium- to coarse-grained sand.

### **3.4 Site-Specific Hydrogeology**

Geosyntec collected depth-to-groundwater measurements in newly installed monitoring wells across the Site (see Section 4.3 and **Appendix C**) in March 2020 prior to groundwater sampling. Based on the measurements, a contour figure was generated for monitoring wells installed from 3 to 13 ft BLS; contour figures were not generated for wells installed from 45 to 65 or 85 to 107 ft BLS due to insufficient monitoring wells installed in these intervals. Groundwater in the wells installed from 3 to 13 ft BLS appears to be influenced by surface water bodies adjacent to the Site. **Figure 6** depicts groundwater elevations from 3 to 13 ft BLS, **Figure 7** depicts groundwater elevations from 45 to 65 ft BLS, and **Figure 8** depicts groundwater elevations from 85 to 107 ft BLS.

Based on groundwater elevation data, there are downward vertical hydraulic gradients between wells installed from 3 to 13 ft BLS and 45 to 65 ft BLS in each well pair [e.g., DEPMW-3 (3-13') and DEPMW-11 (45-65')] and between wells installed from 45 to 65 ft BLS and 85 to 107 ft BLS in each well pair [e.g., DEPMW-11 (45-65') and DEPMW-10 (87-107')].

## 4. SITE CHARACTERIZATION

Field activities were performed in general accordance with FDEP Standard Operating Procedures (SOPs) for Field Activities and internal SOPs for PFAS sampling that were developed by Geosyntec. The sampling locations (including quality assurance/quality control [QA/QC] samples), matrices, depth intervals, sampling methods, laboratory analyses, rationale, and screening criteria used during the assessment activities are summarized on **Table 2**, which reflects any deviations from Preliminary Assessment and Site Assessment Work Plans (and which are further discussed in the sections below). Sample locations are provided on **Figure 9**. Field forms are provided in **Appendix C**, and laboratory analytical reports are provided in **Appendix D**.

Geosyntec prepared a Site-specific Health and Safety Plan (HASP) in July 2019 (updated in January 2020) to address project-specific hazards that were known or suspected to be present due to existing conditions and work to be performed at the Site. The HASP met the requirements specified in the Occupational Safety and Health Administration Hazardous Waste Operations and Emergency Response program and Geosyntec's internal health and safety standards. Geosyntec maintained the HASP on-Site during assessment activities.

### 4.1 Utility Locate

Geosyntec observed GeoTek Services, LLC (GeoTek) perform an underground utility survey prior to soil sampling and drilling activities on 14 August 2019 and 4 February 2020. During both surveys, GeoTek utilized electromagnetic induction and ground penetrating radar to identify any potential subsurface utilities or obstructions. The suspected underground utilities were marked on land surface and sampling or monitoring well locations were repositioned as necessary to avoid potential subsurface conflicts.

### 4.2 Soil Assessment

Geosyntec conducted hand-auger soil sampling at a total of 26 boring locations (4 locations included 2 co-located borings at different intervals) during the 2019 and 2020 assessment activities. Soil sample locations are presented on **Figure 9**. Lithology collected from each soil boring location is presented in **Appendix C** (see general descriptions in Section 3.3).

#### 4.2.1 Soil Sampling Activities

Geosyntec collected a total of 95 discrete soil samples for laboratory analysis in August 2019 and February 2020. Soil samples were collected using decontaminated stainless-steel hand augers. Soil sample intervals and identifications are included in **Table 3**.

In August 2019, Geosyntec collected discrete soil samples for laboratory analysis from the 0 to 1 and 1 to 2 ft BLS depth intervals<sup>1</sup> at 7 locations (SS-1 through SS-7; 14 total soil samples) and documented the corresponding lithology (**Appendix C**). In February 2020, Geosyntec completed 4 soil borings (SB-1, SB-2, SB-6, and SB-7) and collected discrete samples from 2 ft BLS to the water table at select August 2019 boring locations (SS-1, SS-2, SS-6, and SS-7) and from land surface to the encountered water table at 19 additional boring locations (SB-3 to SB-5 and SB-8 to SB-23). The Site Assessment Work Plan proposed the deepest soil sample intervals to be collected from 4 to 6 ft BLS based on previous depth-to-groundwater measurements and anticipated Site conditions; however, the water table at the Site was observed to be approximately 5 ft BLS or shallower during the February 2020 sampling event. Soil sample depth intervals were adjusted accordingly from water table observations in the field. Completed soil borings were backfilled with the unused soil cuttings corresponding to the specific soil boring location and interval from which the soil was removed.

QA/QC samples collected in August 2019 consisted of two equipment blanks (EQB-2 and EQB-3) that were collected from decontaminated hand auger buckets. The QA/QC sample collected in February 2020 consisted of one equipment blank (EQB-4) that was collected from a decontaminated hand auger bucket.

#### **4.2.2 Soil Results**

Analytical laboratory soil sample results are summarized on **Table 3** and depicted on **Figure 10**. PFOS results are presented by individual depth interval on **Figure 11** through **Figure 14**. PFOA results presented by individual depth interval on **Figure 15** through **Figure 18**. Results indicated the following:

- Concentrations of PFOA were above the provisional L-SCTL of 2 µg/Kg at 2 locations (SB-1 / SS-1 and SB-2 / SS-2) within the AFFF usage area; and
- Concentrations of PFOS were above the provisional L-SCTL of 7 µg/Kg at 3 locations (SS-1, SS-2, and SS-3) within the AFFF usage area, 5 locations (SB-5, SS-7, SB-8, SB-14, and SB-18) near the burn building, and 1 location (SB-19) near the former burn props staging area.

#### **4.3 Groundwater Assessment**

Geosyntec installed and sampled two temporary groundwater monitoring wells in August 2019. Based on groundwater results from the 2019 Preliminary Assessment, Geosyntec installed and sampled 13 permanent groundwater monitoring wells between February and March 2020. Monitoring well construction details from both events are summarized in **Table 4**.

---

<sup>1</sup> At the time of the August 2019 assessment activities, samples were collected from 0 to 1 and 1 to 2 ft BLS depth intervals to evaluate the presence or absence of PFAS constituents. Depth intervals used for soil sampling during subsequent assessment activities were revised to 0 to 0.5 and 0.5 to 2 ft BLS in accordance with Chapter 62-780 FAC.

#### **4.3.1 Temporary Monitoring Well Installation and Sampling**

Geosyntec subcontracted Preferred Drilling Solutions, Inc. (PDS) to install two temporary monitoring wells in August 2019. Temporary well TMW-1 was installed in the AFFF usage area identified by PBSC representatives during a Site walk. Temporary well TMW-2 was installed in a grassy, low-lying area to the north of the burn tower and southeast of the burn building near a storm drain location. Temporary well locations are presented on **Figure 9**.

PDS installed the temporary wells to a depth of approximately 14 ft BLS using direct-push technology (DPT). PDS utilized a post-hole digger and/or a hand auger to confirm the absence of subsurface utilities to a depth of up to 5 ft BLS or refusal prior to installing the temporary wells. The wells were constructed with 10 ft of 1-inch diameter polyvinyl chloride (PVC) pre-packed well screen slotted at 0.010 inches and approximately 4 ft of 1-inch diameter PVC riser. The well screens were installed across the water table and the formation was allowed to collapse around each well. The remaining annular borehole space was filled with 20/30 silica sand to at least six inches above the top of the well screen. Geosyntec developed the temporary monitoring wells using a centrifugal pump until the purge water was relatively free of sediment. Construction details for the temporary monitoring wells are provided in **Table 4**. Well construction and development field forms are presented in **Appendix C**.

Immediately following the temporary monitoring well development, Geosyntec utilized a peristaltic pump to collect groundwater samples from TMW-1 and TMW-2 and one duplicate sample (DUP-2) from TMW-1 after stabilization of geochemical field parameters in accordance with FDEP SOPs. Purge water generated during well development and sampling activities was containerized and transported off-Site for disposal (see Section 4.8). PDS removed the temporary monitoring wells after sampling and grouted the boreholes to land surface. Groundwater sampling logs are presented in **Appendix C**.

#### **4.3.2 Permanent Monitoring Well Installation and Surveying**

Geosyntec subcontracted PDS to install 13 permanent monitoring wells in February 2020. Monitoring well locations are presented on **Figure 9**.

PDS installed 8 monitoring wells to a depth of approximately 13 ft BLS using the hollow stem auger (HSA) technique and 5 monitoring wells at varying depths from 65 to 107 ft BLS using the rotosonic technique. PDS utilized a post-hole digger and/or a hand auger to confirm the absence of subsurface utilities to a depth of up to 5 ft BLS or refusal prior to installing the monitoring wells. Continuous soil core samples were collected for lithologic description prior to monitoring well installation using the DPT technique for wells installed to 13 ft BLS and rotosonic technique for 65 to 107 ft BLS. Based on lithologic descriptions, the 13 monitoring wells are considered to be installed at varying depths within the surficial aquifer. Field boring logs containing lithologic descriptions are included in **Appendix C**.

Monitoring wells installed to 13 ft BLS were constructed with 10 ft of 2-inch diameter PVC well screen slotted at 0.010 inches and approximately 3 ft of 2-inch diameter PVC riser. Monitoring wells installed to 65 and 107 ft BLS were constructed of 20 ft of 2-inch diameter PVC well screen

slotted at 0.010 inches and varying lengths of 2-inch diameter PVC riser to land surface. Filter packs consisting of 20/30 silica sand were added from the well terminus to at least 1.5 ft above the top of the well screens. Fine sand seals (30/65 sand) were added to the monitoring wells installed to 13 ft BLS to at least 0.5 ft above the top of the filter packs. Bentonite seals were added to the monitoring wells installed to 65 and 107 ft BLS to at least 3 ft above the top of the filter packs. The remaining annular space in each borehole above the fine sand or bentonite seals was completed using Portland Type I/II grout to land surface. The monitoring wells were completed as flush mounts with 8-inch bolt-down manhole covers in 2 ft by 2 ft concrete well pads. Geosyntec developed the monitoring wells installed to 13 ft BLS (except DEPMW-1) using a peristaltic pump and wells installed to 65 and 107 ft BLS and DEPMW-1 using a submersible pump until the water was relatively free of sediment. Purge water generated during well development activities was containerized and transported off-Site for disposal (see Section 4.8). Monitoring well construction details are provided in **Table 4**. Well construction and development field forms are presented in **Appendix C**.

On 4 March 2020, Kugelmann Land Surveying, Inc., a Florida-licensed surveyor, conducted a survey of the top-of-casing (TOC) elevations (North American Vertical Datum of 1988) and horizontal coordinates (Florida State Plane Coordinate System, East Zone, North American Datum of 1983) at the 13 permanent monitoring well locations. Monitoring well TOC elevations are included in **Table 4**. **Figure 9** depicts the spatial locations of the monitoring wells using the surveyed horizontal coordinates.

#### **4.3.3 Depth-to-Groundwater and Groundwater Sampling Activities**

Geosyntec measured depth-to-groundwater in 13 monitoring wells on 4 March 2020 prior to groundwater sampling. Groundwater levels were measured to the nearest 0.01 ft using an electronic water-level indicator.

Groundwater samples were collected via peristaltic pump after stabilization of water quality parameters including temperature, conductivity, pH, turbidity, and dissolved oxygen. Two duplicate samples were collected at DEPMW-7 (DEPMW-7 (3-13') DUP) and DEMPMW-13 (DEPMW-13 (45-65') DUP). Groundwater sampling logs and calibration forms are included with the field notes in **Appendix C**. The laboratory analytical report is provided in **Appendix D**. Purge water generated during well sampling activities was containerized and transported off-Site for disposal (see Section 4.8).

#### **4.3.4 Groundwater Elevation and Sampling Results**

Depth-to-groundwater measurements and the surveyed TOC elevations were used to calculate groundwater elevations presented in **Table 5**. The groundwater elevation data were plotted, and groundwater elevation maps are provided on **Figure 6** (showing groundwater from 3 to 13 ft BLS), **Figure 7** (showing groundwater from 45 to 65 ft BLS) and **Figure 8** (showing groundwater from 85 to 107 ft BLS). Based on the measurements, a contour figure was generated for monitoring wells installed from 3 to 13 ft BLS; contour figures were not generated for wells installed from 45 to 65 or 85 to 107 ft BLS due to insufficient monitoring wells installed in these intervals.

Groundwater in the wells installed from 3 to 13 ft BLS appears to be influenced by surface water bodies adjacent to the Site.

Analytical laboratory results for the temporary groundwater monitoring well samples collected in August 2019 are summarized in **Table 6** and depicted on **Figure 19**. Results indicated that the individual concentrations of PFOA and PFOS and the summation of the PFOA and PFOS concentrations at both TMW-1 and TMW-2 were above the provisional GCTL of 70 ng/L.

Analytical laboratory results from the permanent monitoring well samples collected in March 2020 are summarized in **Table 6** and depicted on **Figure 19** (showing 3 to 14 ft BLS), **Figure 20** (showing 45 to 65 ft BLS), and **Figure 21** (showing 85 to 107 ft BLS). The vertical extent of PFOS and PFOA is depicted across A-A' in **Figure 22** and B-B' in **Figure 23**. Results indicated the following:

- Concentrations of PFOS and PFOA exceeded their respective provisional GCTLs in DEPMW-1 (3-13') located within the AFFF usage area, DEPMW-2 (3-13') located north of the burn tower, DEPMW-5 (3-13') located north of the burn building, and DEPMW-3 (3-13') and DEPMW-11 (45-65') north of the former burn props staging area;
- PFOS and PFOA were detected above the laboratory MDL at all monitoring well locations installed from 3 to 13 and 45 to 65 ft BLS; and
- Only PFOA was detected above the laboratory MDL at DEPMW-9 (85-105') in the two monitoring wells installed from 85 to 107 ft BLS.

## 4.4 Surface Water Assessment

Geosyntec collected two surface water samples and one duplicate sample in August 2019. The sampling locations are depicted on **Figure 9**.

### 4.4.1 Surface Water Sampling Activities

Geosyntec collected surface water samples using the direct grab technique. One surface water sample (SW-1) and one duplicate sample (DUP-1) were collected from the southeastern portion of the stormwater retention pond located north of the AFFF usage area. The second surface water sample (SW-2) was collected from the E-4 Canal along the eastern boundary of the Site that drains into Lake Osborne. SW-2 was located to the southeast of the former burn props staging area; this area is located to the north of the current retention pond. PBSC representatives stated that no training activities were conducted within the staging area to the north of the retention pond.

### 4.4.2 Surface Water Results

Analytical laboratory results for the surface water samples are summarized in **Table 7** and depicted on **Figure 24**. Since provisional CTLS have not been developed for surface water, individual concentrations of PFOA and PFOS and/or the summation of the PFOA and PFOS concentrations were compared with the provisional GCTL of 70 ng/L to evaluate potential exposure pathways and/or potential sources that could contribute PFAS constituents to groundwater. Results indicated that the concentrations of PFOA and PFOS and the summation of the PFOA and PFOS

concentrations were less than 70 ng/L. Results indicated that the maximum concentration of PFOA and PFOS in the retention pond on-Site was approximately 25 ng/L and the concentration in the E-4 Canal was approximately 54 ng/L.

## 4.5 Sediment Assessment

Geosyntec collected seven sediment samples in August 2019. The sampling locations are depicted on **Figure 9**. Lithology collected from each location is presented in **Appendix C** (see general descriptions in Section 3.3)

### 4.5.1 Sediment Sampling Activities

Geosyntec collected sediment samples using stainless steel hand augers. Two sediment samples (Sed-1 and Sed-7) were collected from the southern portion of the stormwater retention pond located north of the AFFF usage area; Sed-1 was co-located with SW-1. One sediment sample (Sed-2) was collected in the canal along the eastern boundary of the Site, co-located with SW-2. Four sediment samples (Sed-3 through Sed-6) were collected from storm drains set within impervious areas at the central portion of the fire training facility area, where vehicles are generally staged and operated for training purposes. Sed-4 and Sed-5 were located closest to the burn building and burn tower, respectively, and Sed-3 and Sed-4 were closest to the AFFF usage area. QA/QC samples consisted of one field reagent blank (FRB-1) that was collected near Sed-3 following sampling activities. After sample completion, unused sediment was returned to the borehole from which it was removed.

### 4.5.2 Sediment Results

Analytical laboratory sediment results and sample locations are presented on **Figure 24** and results are tabulated in **Table 8**. Since provisional CTLs have not been developed for sediment, individual concentrations of PFOA and PFOS were compared with the provisional L-SCTLs of 2 µg/Kg and 7 µg/Kg, respectively, to evaluate potential sources that could contribute PFAS constituents to Site media (e.g., groundwater and/or surface water). Sediments that remain perpetually submerged do not represent a direct exposure pathway for human health. The results indicated that the concentration of PFOA in sediment samples collected were less than 2 µg/Kg. The concentrations of PFOS was greater than 7 µg/Kg in samples Sed-3 and Sed-6.

## 4.6 Firefighting Foam Sampling

Six 55-gallon drums were observed during August 2019 Preliminary Assessment activities at a location south of the AFFF usage area and adjacent to the building that houses the fire trucks and engines. The drums were labeled with a permanent marker on the top as “Fire-Fighting Foam” and on the side with a label stating, “Chlorohexidine Gluconate 20% Solution.” Chlorohexidine gluconate is a common antimicrobial/antiseptic substance used in the medical and dental industries; therefore, Geosyntec suspects that the 55-gallon drums were repurposed to containerize firefighting foam. A PBSC representative stated that the firefighting foam was donated to the facility for training use.

#### **4.6.1 Firefighting Foam Sampling**

In August 2019, FDEP collected a firefighting foam product sample (designated as “Chlorohexidine Gluconate”) from one of the 55-gallon drums labeled with a permanent marker on the top as “Fire-Fighting Foam” and on the side with a label as “Chlorohexidine Gluconate.”

#### **4.6.2 Firefighting Foam Results**

Analytical results are summarized in **Table 9** and indicate elevated concentrations of PFOS (870,000 µg/kg), PFOA (7,400 µg/kg), and other constituents including perfluorobutanesulfonic acid (PFBS), perfluoroheptanoic acid (PFHpA), perfluorohexanesulfonic acid (PFHxS), and perfluorohexanoic acid (PFHxA).

### **4.7 Decontamination Procedures**

Decontamination activities were performed in accordance with Geosyntec internal SOPs for PFAS sampling either at a designated staging and laydown area or at each monitoring well location. Decontamination procedures utilized for non-disposable, reusable soil, sediment, surface water, and groundwater sampling equipment included decontaminating the sampling equipment in 5-gallon high-density polyethylene (HDPE) buckets. The sampling equipment was first submerged and scrubbed in two 5-gallon HDPE buckets filled with a solution of Liquinox detergent and PFAS-free water provided by FDEP and then submerged in two 5-gallon HDPE buckets filled with PFAS-free water. This sequence of scrubbing and rinsing was performed twice for each hand auger bucket and submersible pump and then followed by a final pour-over rinse of PFAS-free water. Equipment blanks from decontaminated hand auger buckets were collected in August 2019 (EQB-2 and EQB-3) and February 2020 (EQB-4).

The decontamination procedures followed for monitoring well installation equipment included pressure washing DPT, HSA, and rotosonic drilling equipment. Drilling equipment was decontaminated using a pressure washer and Liquinox detergent followed by a series of rinses using PFAS-free water over a constructed wooden and plastic sheeting decontamination pit that collected decontamination fluids. Decontaminated equipment was staged on clean plastic sheeting prior to use. Decontamination fluids were drummed as IDW and disposed off-Site. One equipment blank (EQB-1) was collected from the lead DPT rod prior to installing TMW-1. Equipment blanks were collected from decontaminated HSA (EQB-5) and rotosonic (EQB-6) drill rods prior to installation of permanent monitoring wells. Additionally, one aqueous sample (Drilling Water) was collected from PFAS-free water supplied by PDS.

### **4.8 Investigation Derived Waste**

Two aqueous drums of investigation derived waste (IDW) were generated during the August 2019 assessment event from decontamination activities and temporary monitoring well development and purge water. A total of 39 drums of IDW (16 drums of solid IDW, 14 drums of liquid IDW, and 9 containing a solid / liquid mixture) were generated during the February to March 2020 assessment event from decontamination activities, soil cuttings from drilling, monitoring well development and purge water. The drums were labelled and staged on asphalt at a location approved by PBSC representatives. Field drum inventories are provided in **Appendix C**. IDW

analytical results are provided in **Appendix D**. Final IDW manifests are provided in **Appendix E**.

During the August 2019 assessment event, one composite aqueous sample (labelled IDW-1-Water) was collected from the IDW drums for waste characterization purposes. The composite sample was analyzed for volatile organic compounds (USEPA Method 8260D), semi-volatile organic compounds (USEPA Method 8270D), the 8 Resource Conservation and Recovery Act metals (USEPA Method 6020A and 7473), and PFAS (USEPA Method 8321B). IDW analytical laboratory reports were provided to Perma-Fix Environmental Services, Inc. (Perma-Fix) for profiling and manifest completion. The two drums were removed for off-Site disposal by Perma-Fix on 02 October 2019.

During the February to March 2020 assessment event, one aqueous sample (labelled Water Drum Sample) and one solid sample (labelled Soil Drum Sample) were collected from IDW drums for waste characterization purposes. The 2020 IDW samples were analyzed for similar constituents using similar analytical methods to the 2019 IDW sample except for semi-volatile organic compounds (USEPA Method 8270E). The IDW analytical laboratory report was provided to Universal Environmental Solutions, LLC (UES) for profiling and manifest completion. The 39 drums were removed for off-Site disposal by UES on 15 April 2020.

## 5. CONCLUSIONS

During assessment activities conducted in 2019 and 2020, Geosyntec collected samples of Site media (groundwater, surface water, sediment, soil, and firefighting foam) for laboratory analysis of PFAS constituents. The concentrations of PFOA and PFOS in groundwater and soil were screened against provisional CTLs, and the results from surface water and sediment were evaluated to identify potential exposure pathways and/or potential PFAS sources. The results indicated the following:

- Soil concentrations of PFOA and/or PFOS were above the provisional L-SCTLs at multiple depth intervals at 3 soil borings within the AFFF usage area, 2 locations along the E-4 Canal, and 4 locations north of the burn building. The results indicate that PFOA and PFOS could be leaching from soil to groundwater at concentrations above provisional GCTLs and may represent potential sources at these locations;
- Groundwater concentrations of PFOA and PFOS from two temporary monitoring wells near the center of the grass-covered AFFF usage area and the grass-covered low-lying area between the burn building and burn tower were above the provisional GCTLs;
- Groundwater concentrations of PFOA and PFOS were above provisional GCTLs in 4 monitoring wells installed from 3 to 13 ft BLS and 1 monitoring well installed from 45 to 65 ft BLS. The downward vertical gradient and lack of a true confining unit between monitoring wells installed from 3 to 13 and 45 to 65 ft BLS represents a potential vertical migration pathway for PFAS from land surface throughout the surficial aquifer;
- Surface water concentrations of PFOA and PFOS within the retention pond north of the AFFF usage area and the E-4 Canal, northeast of the Site, do not represent a potential exposure pathway based solely on the consumption of surface water; and
- Sediment concentrations of PFOS in two of the on-Site storm drains may represent a potential source of PFAS constituents that could leach from the sediment to groundwater and/or surface water that contacts sediment in these storm drains.

## 6. RECOMMENDATIONS

Geosyntec recommends the following:

- Collect additional soil samples to delineate the horizontal extent of PFAS adjacent to sample locations with concentrations exceeding the provisional L-SCTL;
- Collect additional sediment and co-located surface water samples to evaluate the presence or absence of PFAS in sediment and surface water bodies adjacent to sampling locations with groundwater or soil exceedances above provisional CTLs;
- Install staff gauges or employ other methods to determine the surface water elevation in the E-4 canal to evaluate the groundwater and surface water interaction;
- Collect DPT groundwater samples in strategic locations to update the current horizontal and vertical groundwater data gaps across the area of environmental assessment; and
- Install additional monitoring wells to delineate the horizontal and/or vertical extent of PFAS concentrations exceeding the provisional GCTL.

A work plan summarizing the proposed sampling activities will be submitted to the FDEP under a separate cover.

**Notes:**

1. FDOH indicates Florida Department of Health.
2. ft BLS indicates feet below land surface.
3. -- indicates information not specified through FDOH Well Surveillance Program website.
4. Active indicates the well is used on a regular basis or will be used within a reasonable period of time (2 to 3 months).
5. Inactive indicates the well has not been regularly used within the past 6 to 12 months but is maintained in such a state that it could be used.

TMW-2	TMW-2 (4-14')		4-14						
Firefighting Foam Product									
Product	Chlorohexidine Gluconate <sup>20</sup>	Firefighting Foam	N/A		PFAS	Firefighting Foam currently stored at Facility	N/A		

**TABLE 2: SAMPLING LOCATIONS, MATRICES, ANALYTES, RATIONALE, AND CRITERIA**  
**Palm Beach State College**

Laboratory QA/QC Samples									
Drum Number	Sample ID	Matrix	Equipment Sampled	Analysis	Rationale	Criteria			
Field Reagent Blanks	FRB-1		N/A		Evaluate potential impact of sample cross-contamination				
	FRB-2				Assess potential sources of contamination from monitoring well installation equipment				
	FRB 3-4-20				Assess potential sources of contamination from monitoring well installation and HA sampling equipment				
Equipment Blanks	EQB-1	Water	DPT core barrel	PFAS	Assess potential sources of contamination from monitoring well installation equipment	N/A			
	EQB-2		HA bucket						
	EQB-3								
	EQB-4		HSA drill rod						
	EQB-5		Sonic drill rod						
	EQB-6		Driller-provided decontamination water						
	Drilling Water								
Investigation Derived Waste Sample									
Drum Number	Sample ID	Matrix	IDW Source	Analysis	Rationale	Criteria			
1, 2	IDW-1-Water	Water	Decontamination and purge water	VOCs, SVOCs, RCRA metals, PFAS	Waste characterization	N/A			
4	Water Drum Sample								
9	Soil Drum Sample	Soil	Soil cuttings						

**Notes:**

1. DPT indicates direct push technology.
2. ft BLS indicates feet below land surface.
3. SB and SS indicate soil boring.
4. Sed indicates sediment.
5. SW indicates surface water.
6. DUP indicates duplicate.
7. TMW indicates temporary monitoring well.
8. HA indicates hand auger.
9. HSA indicates hollow stem auger.
10. PFAS indicates per- and polyfluoroalkyl substances.
11. N/A indicates not applicable.
12. QA/QC indicates quality assurance/quality control.
13. FRB indicates field reagent blank.
14. EQB indicates equipment blank.
15. AFFF indicates aqueous film forming foam.
16. IDW indicates investigation derived waste.
17. VOCs indicate volatile organic compounds.
18. SVOCs indicate semi-volatile organic compounds.
19. RCRA indicates Resource Conservation and Recovery Act.
20. Product drums were labeled with permanent marker on the top as "Fire-Fighting Foam" and on the side with a label as "Chlorhexidine Gluconate 20% Solution"

**Notes:**

- Results and screening criteria are presented in micrograms per kilogram ( $\mu\text{g}/\text{kg}$ ).
- ft BLS indicates feet below land surface.
- U indicates that the compound was analyzed for but not detected (the laboratory method detection limit (MDL) is shown).
- I indicates the result is between the laboratory MDL and the practical quantitation limit.
- J indicates an estimated value and/or the analysis did not meet established quality control criteria.
- Grey shaded, bold text indicates an exceedance of the FDEP provisional leachability SCTL.
- "--" indicates no screening criteria.

Analyte	Acronym

**Notes:**

- Results and screening criteria are presented in nanograms per liter (ng/L).
- PFOA + PFOS indicates the summation of PFOA and PFOS concentrations.
- Blue shaded, bold text indicates an exceedance of the Florida Department of Environmental Protection provisional groundwater cleanup target level (GCTL).
- indicates no applicable cleanup target level.
- U indicates material was analyzed for but not detected. The reported value is the method detection limit (MDL) for the sample analyzed.
- I indicates the reported value is between the laboratory MDL and the laboratory practical quantitation limit.
- J indicates estimated value and/or the analysis did not meet the quality control criteria.
- PFAS indicates per- and polyfluoroalkyl substances.

Analyte	Acronym
Perfluorooctanesulfonic acid	PFOS
Perfluorooctanic acid	PFO A
4:2 Fluorotelomer sulfonate	4:2 FTS
6:2 Fluorotelomer sulfonate	6:2 FTS
8:2 Fluorotelomer sulfonate	8:2 FTS
N-ethylperfluorooctanesulfonamidoacetic acid	NEtFOSAA
N-methylperfluorooctanesulfonamidoacetic acid	NMeFOSAA
Perfluorobutanesulfonic acid	PFBS
Perfluorodecanesulfonic acid	PFDS
Perfluorodecanoic acid	PFDA
Perfluorododecanoic acid	PFDoA
Perfluoroheptanesulfonic acid	PFHpS
Perfluoroheptanoic acid	PFHpA
Perfluorohexanesulfonic acid	PFHxS
Perfluorohexanoic acid	PFHxA
Perfluorononanesulfonic acid	PFNS
Perfluorononanoic acid	PFNA
Perfluoropentanesulfonic acid	PPeS
Perfluoropentanoic acid	PPPeA
Perfluorotetradecanoic acid	PFTeA
Perfluorotridecanoic acid	PFTriA
Perfluoroundecanoic acid	PFUnA

**Notes:**

1. Results are presented in nanograms per liter (ng/L).
2. Surface water screening levels are under development.
3. PFOA + PFOS indicates the summation of PFOA and PFOS concentrations.
4. U indicates material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
5. I indicates result is between the laboratory method detection limit and the laboratory practical quantitation limit.
6. PFAS indicates per- and polyfluoroalkyl substances.

Analyte	Acronym
Perfluorooctanesulfonic acid	PFOS
Perfluorooctanic acid	PFOA
4:2 Fluorotelomer sulfonate	4:2 FTS
6:2 Fluorotelomer sulfonate	6:2 FTS
8:2 Fluorotelomer sulfonate	8:2 FTS
N-ethylperfluorooctanesulfonamidoacetic acid	NEtFOSAA
N-methylperfluorooctanesulfonamidoacetic acid	NMeFOSAA
Perfluorobutanesulfonic acid	PFBS
Perfluorodecanesulfonic acid	PFDS
Perfluorodecanoic acid	PFDA
Perfluorododecanoic acid	PFDoA
Perfluoroheptanesulfonic acid	PFHpS
Perfluoroheptanoic acid	PFHpA

Re: Development of alternative soil cleanup target levels for PFOA and PFOS

Dear Dr. Dougherty:

At your request, we have developed alternative soil cleanup target levels (ASCTLs) for perfluorooctanoic acid (PFOA; CAS# 335-67-1) and perfluorooctane sulfonate (PFOS; CAS# 1763-23-1). PFOA and PFOS are perfluoroalkyl substances (PFASs). PFASs are used to make products resistant to stains, grease, and water. Before production was phased out at the end of 2015, PFOA was used in carpets, leathers, textiles, upholstery, and as a waterproofing or stain-resistant agent (USEPA, 2016a). In 2002, the only major US manufacturer of PFOS agreed to phase out production. However, PFOA and PFOS degrade slowly and are persistent in the environment. Most contamination by PFOA and PFOS is a result of releases from manufacturing sites, industrial sites, fire training areas, and waste sites where these chemicals were disposed (USEPA, 2016a & 2016b). Derivation of the ASCTLs for each chemical is described below.

#### Perfluorooctanoic Acid (PFOA)

The United States Environmental Protection Agency (USEPA) summarized toxicity studies for PFOA in the Drinking Water Health Advisory for PFOA (USEPA, 2016a). For reference dose (RfD) development, several candidate studies and health effect endpoints were evaluated (Perkins et al., 2004; Lau et al., 2006; Wolf et al., 2007; White et al., 2009; DeWitt et al., 2008; Butenhoff et al., 2004). A total of six candidate RfDs were considered based upon endpoints including increased liver weight and necrosis in rats, decreased pup weight from gestational exposure in mice, immunosuppression in mice, reduced ossification and accelerated male puberty in offspring of mice, and reduced body weight and increased kidney weight (relative and absolute) in rats. For each animal toxicity study, human equivalent average serum PFOA concentrations were derived using a pharmacokinetic model by Wambaugh et al. (2013). An oral reference dose (RfD) was derived for each human equivalent no observed adverse effect level (NOAEL) or lowest observed adverse effect level (LOAEL) using study-specific uncertainty factors. Three endpoints resulted in a RfD of 2E-05 mg/kg-d (the lowest calculated RfD). Among these, reduced ossification of the proximal phalanges and accelerated puberty in offspring from treated dams in the study by Lau et al. (2006) were selected as the critical

effect(s). Other studies producing the same or similar RfD values are considered supportive. Data were not considered adequate to derive a reference concentration (RfC) for inhalation exposure.

In the Lau et al. (2006) study, pregnant CD-1 mice were dosed with 1, 3, 5, 10, 20, or 40 mg/kg PFOA by oral gavage daily from gestational day 1 to 17. Decreased ossification of pup (both sexes) proximal phalanges and accelerated preputial separation were seen at 1 mg/kg PFOA. The USEPA calculated a human equivalent point of departure of 5.3E-03 mg/kg-d for these endpoints. An uncertainty factor of 300 (3 for extrapolation from animal to human, 10 for extrapolation from LOAEL to NOAEL, and 10 for sensitive individuals) was applied to derive an oral RfD of 2E-05 mg/kg-d. Greater than 95% of PFOA is absorbed by the gastrointestinal tract (ATSDR, 2015). Therefore, a gastrointestinal absorption factor of 1 was used to extrapolate the toxicity to other routes of exposure.

PFOA is also carcinogenic and has been shown to be tumorigenic in the liver, testes, and pancreas of rats. In humans, there is epidemiological evidence for an association between serum PFOA and kidney and testicular tumors (USEPA, 2016a). The USEPA developed an oral cancer slope factor of 7E-02 per mg/kg-d based on the development of testicular tumors in rats. They concluded that the drinking water health advisory based on non-cancer effects was protective for the cancer endpoint. We also calculated ASCTLs based on the oral cancer slope factor of 7E-02 per mg/kg-d (ASCTLs not shown). These ASCTLs were higher than those protective of non-cancer endpoints confirming that ASCTLs based on non-cancer effects are protective of the cancer endpoint.

Direct exposure ASCTLs for residential and commercial/industrial scenarios were calculated using the formula presented in Figure 5 of Chapter 62-777, Florida Administrative Code (F.A.C.). The equation is shown in Figure 1. Default assumptions listed in Table 1 were taken from OSWER Directive 9200.1-120 (USEPA, 2014) and Table 3 of Chapter 62-777, F.A.C. Chemical-specific parameters are presented in Table 2. **The residential ASCTL for PFOA is 1.3 mg/kg and the commercial/industrial ASCTL is 25 mg/kg.** A leachability ASCTL was derived using the formula presented in Figure 8 of Chapter 62-777, FAC. The equation is shown in Figure 2 and inputs are listed in Table 1. **The ASCTL for leachability to groundwater is 0.004 mg/kg** (based on an alternative groundwater cleanup target level of 0.1 µg/L provided to you in a letter dated April 12, 2017).

### Perfluorooctane Sulfonate (PFOS)

The USEPA summarized toxicity studies for PFOS in the Drinking Water Health Advisory for PFOS (USEPA, 2016b). Six candidate studies and seven endpoints were identified for the derivation of an RfD for PFOS (Seacat et al., 2002 & 2003; Luebker et al., 2005a & 2005b; Butenhoff et al., 2009; Lau et al., 2003). Candidate endpoints included: 1) increased liver weight and histopathology, decreased body weight, and thyroid hormone disturbances in monkeys; 2) increased liver weight and histopathology, and increased liver enzymes and blood urea nitrogen in serum in male rats; 3) decreased body weight of rat pups; 4) another study showing decreased body weight in rat pups; 5) decreased maternal body weight, gestation length, and pup survival in rats; 6) developmental neurotoxicity in rats; and 7) decreased pup survival and decreased maternal and pup body weight in rats. For each animal toxicity study, human equivalent average serum PFOS concentrations were derived using a pharmacokinetic model by Wambaugh et al. (2013). An oral RfD was derived for each human equivalent NOAEL or LOAEL using study-specific uncertainty factors. Data were not considered adequate to derive a

reference concentration (RfC) for inhalation exposure. The USEPA selected reduced pup weight from a two-generation study in rats as the critical effect. Low body weight was considered to be a marker for developmental effects, including effects that may not be manifested until later in life. This effect is considered relevant to humans because PFOS has been measured in the blood of newborns, in breast milk, and in blood of older children.

The developmental toxicity study by Luebker et al. (2005a) resulted in a RfD of 2E-05 mg/kg-d (the lowest calculated RfD). In this study, male and female rats were dosed with 0, 0.1, 0.4, 1.6, or 3.2 mg/kg-d by gavage from six weeks prior to mating, during mating, and, for females, through gestation and lactation across two generations. Rat pup weight was significantly decreased at 1.6 mg/kg-d PFOS in the F1 generation. The USEPA calculated a human equivalent point of departure of 5.1E-04 mg/kg-d based on decreased rat pup weight in the F1 generation. An uncertainty factor of 30 (3 for extrapolation from animal to human and 10 for sensitive subpopulations) was applied to derive an oral RfD of 2E-05 mg/kg-d. No data are available regarding the gastrointestinal absorption of PFOS. Therefore, a gastrointestinal absorption factor of 1 was used to extrapolate the toxicity to other routes of exposure.

There is also suggestive evidence that PFOS is carcinogenic in humans based on chronic studies in rats that result in liver and thyroid adenomas. However, the tumor data lack a dose-response relationship and could not be used by the USEPA to develop a cancer slope factor. Therefore, the critical effect for PFOS is developmental toxicity.

Direct exposure ASCTLs for residential and commercial/industrial scenarios were calculated using the formula presented in Figure 5 of Chapter 62-777, Florida Administrative Code (F.A.C.). The equation is shown in Figure 1. Default assumptions listed in Table 1 were taken from OSWER Directive 9200.1-120 (USEPA, 2014) and Table 3 of Chapter 62-777, F.A.C. Chemical-specific parameters are presented in Table 2. **The residential ASCTL for PFOS is 1.3 mg/kg and the commercial/industrial ASCTL is 25 mg/kg.** A leachability ASCTL was derived using the formula presented in Figure 8 of Chapter 62-777, FAC. The equation is shown in Figure 2 and inputs are listed in Table 1. **The ASCTL for leachability to groundwater is 0.01 mg/kg** (based on an alternative groundwater cleanup target level of 0.1 µg/L provided to you in a letter dated April 12, 2017).

As with the PFOA and PFOS alternative groundwater cleanup target levels (AGCTLs) provided to you previously, these ASCTLs have been calculated using default equations and exposure assumptions from Chapter 62-777, F.A.C. (the ASCTLs also include updated exposure assumptions from OSWER Directive 9200.1-120). Recently, the USEPA and a number of states have modified their calculation of PFOA and PFOS criteria based upon the critical effects, which are developmental in nature, and/or the availability of serum concentration data for these chemicals. For example, the USEPA Health Advisories for PFOA and PFOS in drinking water are based upon a water consumption rate for a lactating woman to protect the breast fed infant rather than a standard adult drinking water consumption rate. This higher rate of consumption leads to a lower acceptable drinking water concentration (0.07 µg/L rather than 0.1 µg/L calculated with Chapter 62-777 F.A.C. assumptions). New Jersey and Minnesota have both used serum concentration data rather than the USEPA oral reference dose to derive acceptable concentrations of PFOA and PFOS in drinking water that are lower than the USEPA Health Advisories. The Minnesota approach specifically targets serum concentrations in the breast fed infant. Other than a general protection of children when developing SCTLs, Florida has not typically tailored calculation of cleanup target levels (CTLs) to address sensitive life stages when they have been identified. With increased attention to the issue of sensitive life stages in the context of PFOA and PFOS exposure, the Florida Department of Environmental

Protection (FDEP) may want to consider as a general matter when and to what extent sensitive life stages should be addressed in CTL development.

Please let us know if you have any questions regarding the development of these ASCTLs.

Sincerely,

Leah D. Stuchal, Ph.D.

Stephen M. Roberts, Ph.D.

Re: Calculation of an AGCTL for PFOA/PFOS protective of sensitive lifestages

Dear Ms. Smith:

We have developed an alternative groundwater cleanup target level (AGCTL) for perfluorooctanoic acid (PFOA; CAS# 335-67-1) and perfluorooctane sulfonate (PFOS; CAS# 1763-23-1) protective of sensitive lifestages/receptors. We previously developed AGCTLs for PFOA and PFOS in letters to the Florida Department of Environmental Protection (FDEP) dated April 12, 2017. These AGCTLs incorporated updated toxicity values based on the USEPA Drinking Water Health Advisories for PFOA and PFOS (USEPA, 2016a & 2016b) and updated exposure parameters for adults listed in the 2011 Exposure Factors Handbook (USEPA, 2011). At that time, we were requested to use a drinking water ingestion rate applicable to a generic adult receptor, which is the approach used in the development of groundwater cleanup target levels (GCTLs) in Chapter 62-777, F.A.C. The resulting GCTL for both PFOA and PFOS was 0.1 µg/L.

The critical effects for both of these chemicals are developmental effects. For PFOA, the critical effects are decreased ossification of pup (both sexes) proximal phalanges and accelerated preputial separation. For PFOS, the critical effect is decreased pup weight in the F<sub>1</sub> generation. The F<sub>1</sub> generation is the first generation of pups born after parental exposure. Exposure usually takes place while pups are in utero and may last through lactation and weaning. Because the critical effects are development endpoints, adverse effects can result from short-term exposure during critical periods of development. The 90<sup>th</sup> percentile drinking water ingestion rate for lactating women (0.054 L/kg-d; USEPA, 2011) is used by the USEPA in the development of their drinking water criterion due to the potential increased susceptibility from higher drinking water rates during pregnancy and lactation (USEPA 2016a & 2016b). From a toxicological standpoint, it is more appropriate to use a drinking water ingestion rate applicable to the most sensitive lifestage/receptor in the development of a cleanup target level, than a default drinking water rate for an adult.

At your request, we have calculated AGCTLs for PFOA and PFOS protective of sensitive lifestages based on the 90<sup>th</sup> percentile drinking water ingestion rate of 0.054 L/kg-d for lactating women. For developmental effects, AGCTLs of 0.07 µg/L were derived for both PFOA and PFOS using the formula in Figure 2 of Chapter 62-777, FAC. The AGCTLs for these two

*The Foundation for The Gator Nation*

An Equal Opportunity Institution

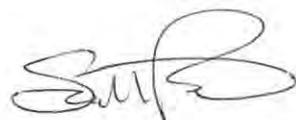

chemicals are identical because their oral reference doses are also identical (2E-05 mg/kg-d). The calculation and exposure assumptions used are shown in Figure 1 below. Because of the similarity in adverse effects and potency of these chemicals, the USEPA recommends that, where PFOA and PFOS are co-located, the sum of the concentrations of these chemicals should be compared to the drinking water criterion (USEPA, 2016a & 2016b). Therefore, **the sum of PFOA and PFOS concentrations should be compared to the AGCTL of 0.07 µg/L.**

In deriving these AGCTLs, we note that the Agency for Toxic Substances and Disease Registry (ATSDR) has recently released for public comment a draft toxicological profile for perfluoroalkyl chemicals, including PFOA and PFOS. The proposed Minimal Risk Levels for PFOA and PFOS are an order of magnitude lower than their USEPA reference doses, prompting discussion within the scientific and regulatory community whether the USEPA reference doses should be re-visited and perhaps revised downward. We recommend following this discussion closely and making further modifications to the AGCTLs if warranted. Please let us know if you have any questions regarding the development of this AGCTL.

Sincerely,

Leah D. Stuchal, Ph.D.

Stephen M. Roberts, Ph.D.

Re: Leachability SCTLs for PFOA and PFOS based on the alternative GCTL of 0.07 µg/L

Dear Ms. Smith:

At your request, we have calculated leachability soil cleanup target levels (SCTLs) for perfluorooctanoic acid (PFOA; CAS# 335-67-1) and perfluorooctane sulfonate (PFOS; CAS# 1763-23-1) based on the alternative groundwater cleanup target level (AGCTL) of 0.07 µg/L for the protection of sensitive lifestages. The leachability SCTLs were calculated using the equation in Figure 5 of Chapter 62-777, F.A.C. Chemical-specific properties used in the calculation were taken from our letter regarding the calculation of SCTLs for PFOA and PFOS (dated April 16, 2018. Based on these parameters, **the leachability SCTL for PFOA is 0.002 mg/kg and the leachability SCTL for PFOS is 0.007 mg/kg**. Please let us know if you have any questions regarding these calculations.

Sincerely,

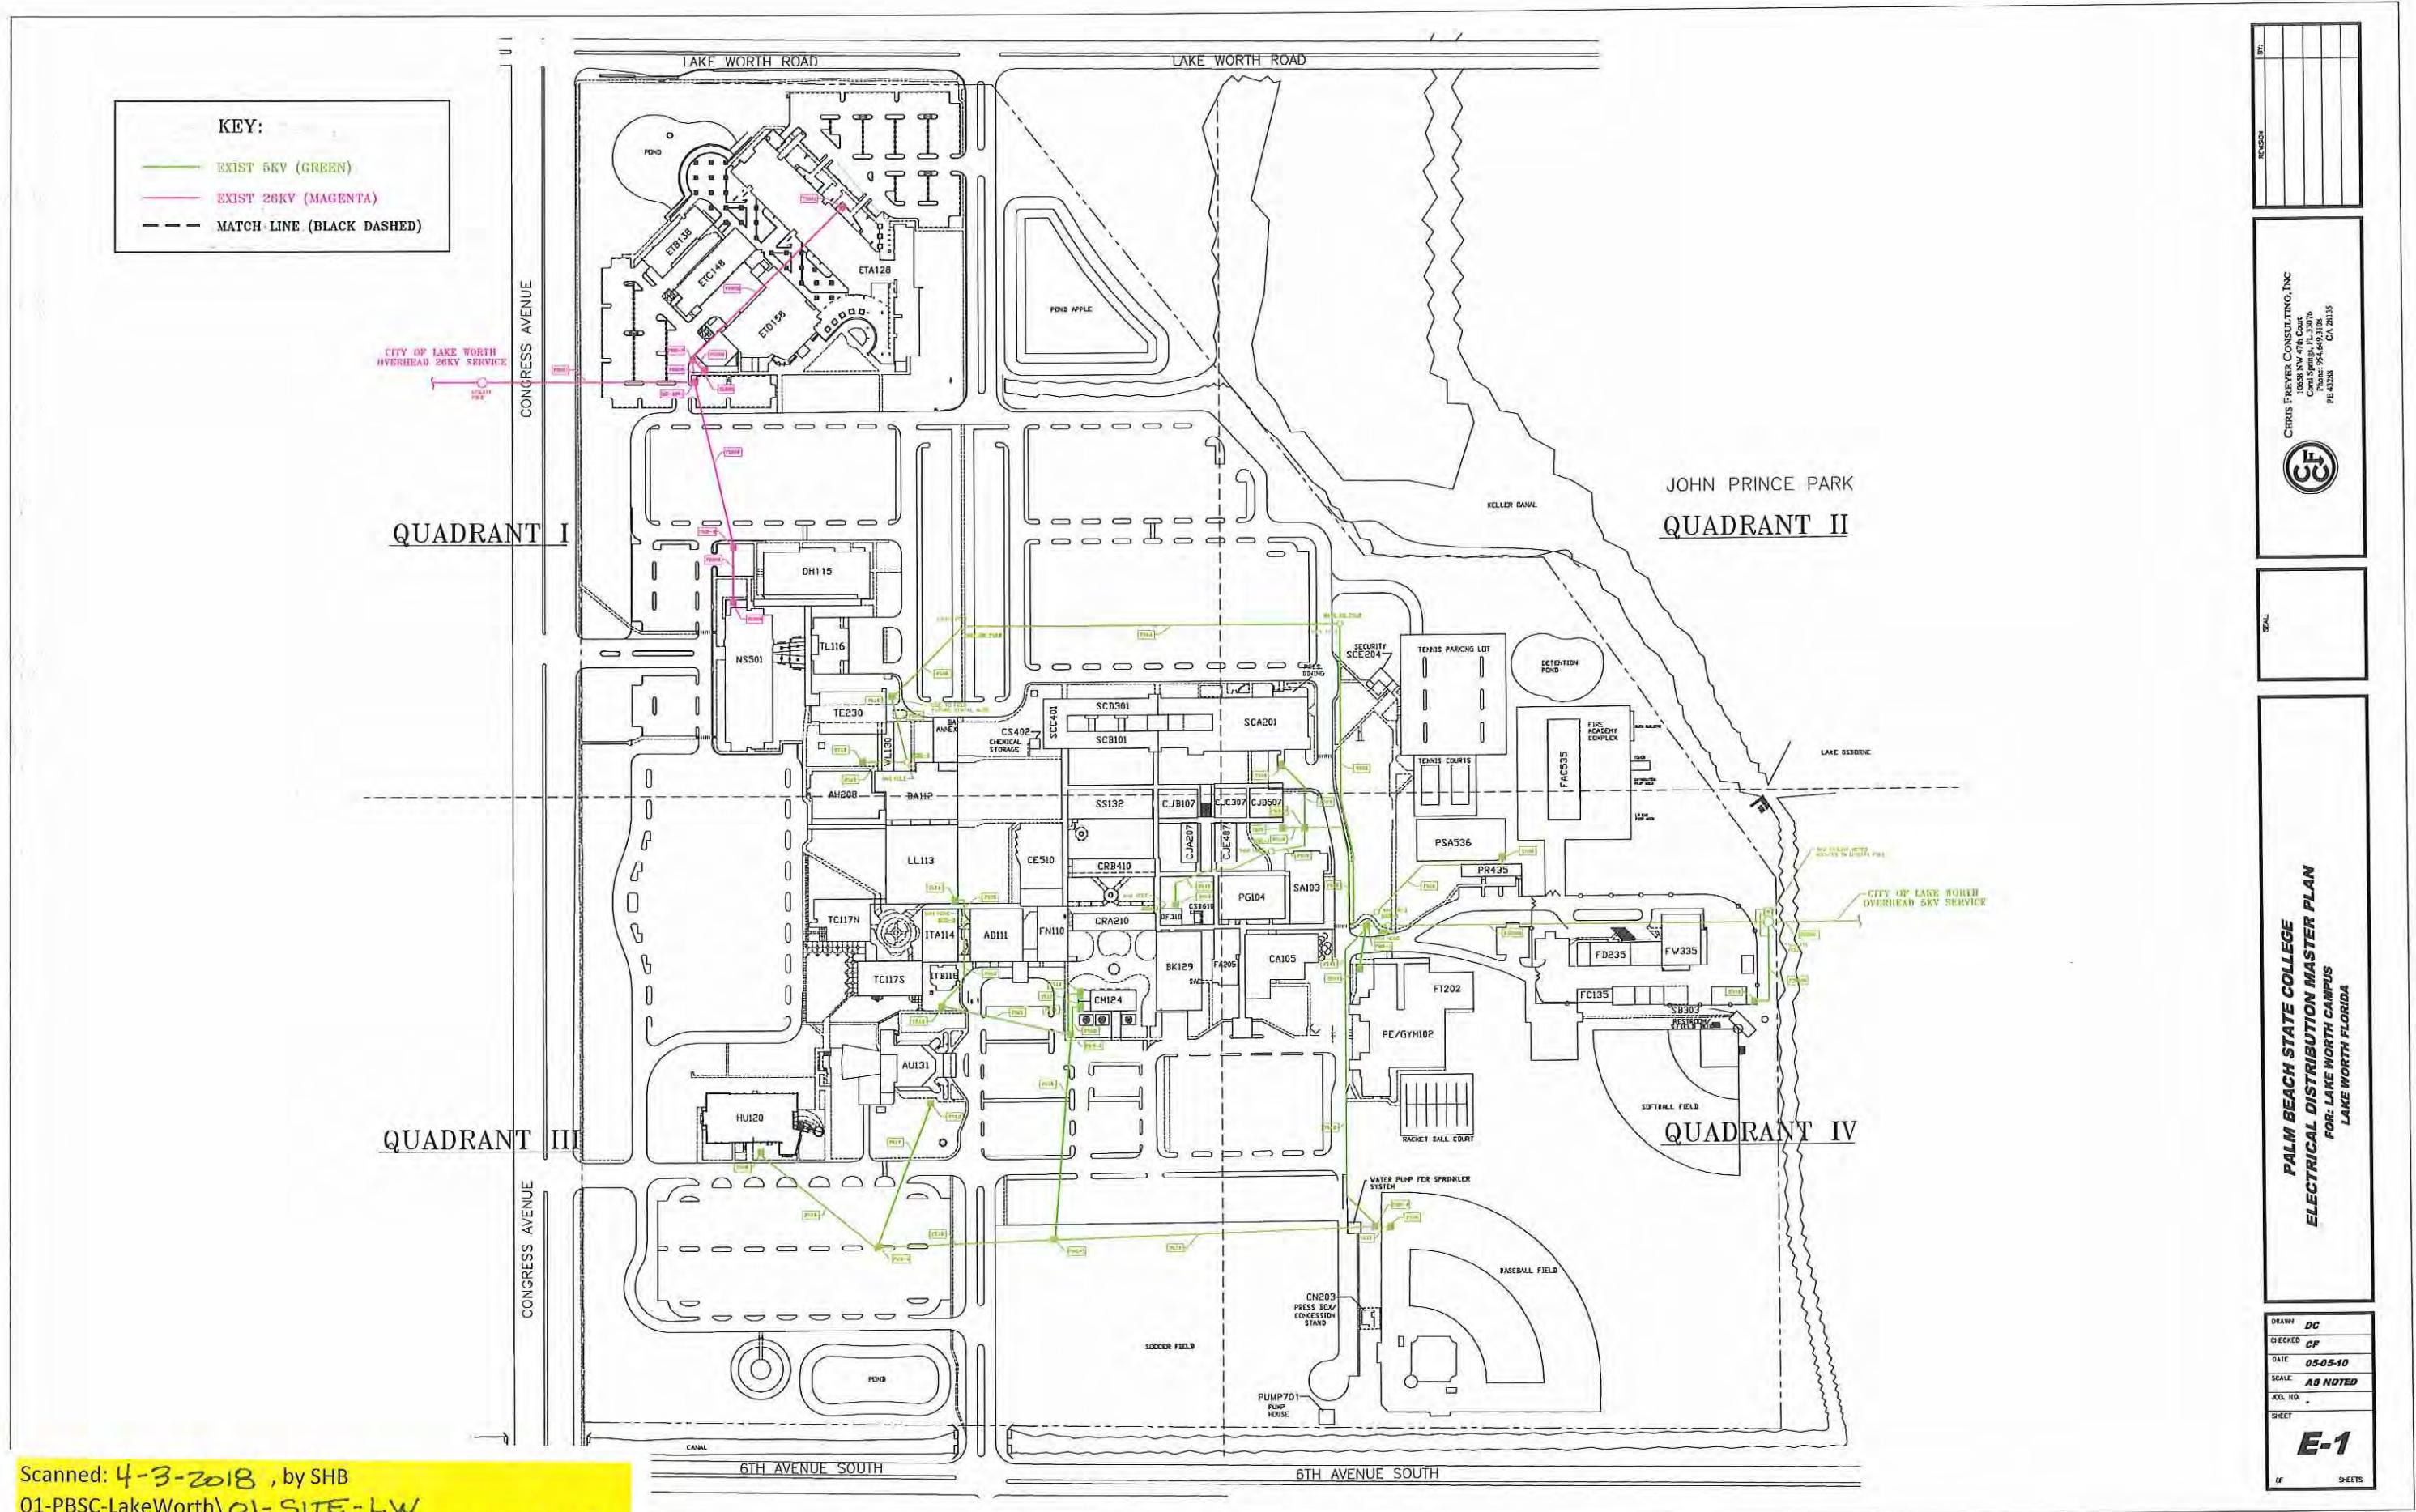

Leah D. Stuchal, Ph.D.

Stephen M. Roberts, Ph.D.

## **APPENDIX C**

### Field Forms

## Attachment A. Daily PFAS Sampling Checklist

Date: 8/14/19

Site Name: Palm Beach State College

Weather (temperature/precipitation): Sunny, high of 90°F

**Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.**

### Field Clothing and PPE:

- No water- or stain-resistant clothing (e.g., GORE-TEX®)
- During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- Clothing has not been recently laundered with a fabric softener
- No coated HDPE suits (e.g., coated Tyvek® suits)
- Field crew has not used cosmetics, moisturizers, or other related products today
- Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

### Field Equipment:

- Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- No materials containing Teflon™, Viton™, or fluoropolymers
- No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- No plastic clipboards, binders, or spiral hard cover notebooks
- No waterproof field books
- No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- No chemical (blue) ice, unless it is contained in a sealed bag
- No aluminum foil
- No sticky notes (e.g., certain Post-It® products)

### Decontamination:

- Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- "PFAS-free" water is on-site for decontamination of field equipment
- Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- No food or drink on-site, except within staging area
- Food in staging area is contained in HDPE or stainless steel container

Observations/Issues of Concern	
0725	Audrey Battier (AB) leaves hotel for Palm Beach State College (PBSC)
0745	AB onsite.
0750	Dennis Jensen and Bobby (FDEP) onsite. Amy Descantis, Andrew Janeczek, Mary Turner and PDS onsite.
0812	AB gives tailgate safety + discusses SOW.
0820	PDS begins setting up down pit while Geosyntec sets up H2A bucket decon station and marks locations. AD speaks w/ fire personnel about area near burn tower to south (where burn props located) - he indicated no AFFF usage - only propane. AD adds SS-4 thru SS-6 in gas field area and SS-7 east of burn building adjacent to canal.
	DJ adds <del>SS</del> Sed-7 noah of SS-1 in retention pond.
	DJ did not want to add 2nd TMW.
0845	Bud begins utility locator
0910	AB samples SW-1 and DUP-1

Plans/Future Activities

Observations/Issues of Concern	
FDEP + Geosyntec decide to install TMW-2 in gas field area depression.	
1020	PDS finish setting TMU-1 @ 4-14 ft
1125	sample TMU-1 (4-14) and collect DUP-2(4-14).
1145	AB + DJ check samples to CEC
12-12:30	lunch break
1250	AB+AD complete soil borings, begin collecting sediment samples including additional Sed-7 from high side of retention pond
1400	complete sed samples (including 4 from grates)
1420	AD complete FRB-1
1425	offsite w/ AD and FDEP, headed to PBPR. AJ and MT stay onsite (waiting out rain) to finish GPSing point
1500	AB + AD onsite @ PBPR w/ FDEP. Check in w/ Captain Geosyntec + FDEP mark boring locations for work on 8/15.
1545	Geosyntec and FDEP off-site

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

ICV = Initial Calibration Verification

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings <0.1 mS/cm is acceptable)

CCV = Continuing Calibration Verification

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed

\* See Table FS 2200-2 on the back of this form If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

## Attachment A. Daily PFAS Sampling Checklist

Date: 2/4/20

Site Name: Palm Beach State College

Weather (*temperature/precipitation*): 70°F, sunny

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

### Field Clothing and PPE:

- No water- or stain-resistant clothing (e.g., GORE-TEX®)
- During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- Clothing has not been recently laundered with a fabric softener
- No coated HDPE suits (e.g., coated Tyvek® suits)
- Field crew has not used cosmetics, moisturizers, or other related products today
- Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

### Field Equipment:

- Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- No materials containing Teflon™, Viton™, or fluoropolymers
- No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- No plastic clipboards, binders, or spiral hard cover notebooks
- No waterproof field books
- No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- No chemical (blue) ice, unless it is contained in a sealed bag
- No aluminum foil
- No sticky notes (e.g., certain Post-It® products)

### Decontamination:

- Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- "PFAS-free" water is on-site for decontamination of field equipment
- Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- No food or drink on-site, except within staging area  
 Food in staging area is contained in HDPE or stainless steel container

Notes:

Soil sampling with no booties

## Attachment A. Daily PFAS Sampling Checklist

Date: 2/5/20

Site Name: Palm Beach State College

Weather (temperature/precipitation): 75°F, Sunny

Please check all boxes that apply and describe any exceptions in the notes section below along with QA/QC methods used to assess potential sample cross-contamination as a result.

### Field Clothing and PPE:

- No water- or stain-resistant clothing (e.g., GORE-TEX®)
- During collection of water and sediment samples, no water- or stain-resistant boots OR water- or stain-resistant boots covered by PFAS-free over-boots
- Field boots (or over-boots) are made of polyurethane, PVC, rubber, or untreated leather
- Waders or rain gear are made of polyurethane, PVC, vinyl, wax-coated or rubber
- Clothing has not been recently laundered with a fabric softener
- No coated HDPE suits (e.g., coated Tyvek® suits)
- Field crew has not used cosmetics, moisturizers, or other related products today
- Field crew has not used sunscreen or insect repellants today, other than products approved as PFAS-free

### Field Equipment:

- Sample containers and equipment in direct contact with the sample are made of HDPE, polypropylene, silicone, acetate or stainless steel, not LDPE or glass
- Sample caps are made of HDPE or polypropylene and are not lined with Teflon™
- No materials containing Teflon™, Viton™, or fluoropolymers
- No materials containing LDPE in direct contact with the sample (e.g., LDPE tubing, Ziploc® bags)
- No plastic clipboards, binders, or spiral hard cover notebooks
- No waterproof field books
- No waterproof or felt pens or markers (e.g., certain Sharpie® products)
- No chemical (blue) ice, unless it is contained in a sealed bag
- No aluminum foil
- No sticky notes (e.g., certain Post-It® products)

### Decontamination:

- Reusable field equipment (e.g., inner drill rods, samplers) decontaminated prior to reuse
- "PFAS-free" water is on-site for decontamination of field equipment
- Alconox® or Liquinox® used as decontamination detergent

Food and Drink:

- No food or drink on-site, except within staging area
- Food in staging area is contained in HDPE or stainless steel container

Notes: No booties needed during sampling or drilling

Field Team Leader Name (Print): Andrew Galvin

Field Team Leader Signature: 

Date/Time: 3/4/20 805

PROJECT NAME: Palm Beach State College DATE: 2/4/20  
LOCATION: Lake Worth, FL PROJECT NO: FR3630E PHASE NO: 01  
DESCRIPTION: utility locate, soil sampling  
SUBCONTRACTOR(S): Geotek  
WEATHER: sunny, high of 78°F  
GEOSYNTEC PERSONNEL: Amy DeSantis (AD), Andrew Galvin (AG),  
Josh Udvardy (JU) + JJ Hollingshead (JH)

- 740 AD onsite.
- 745 AG onsite.
- 755 JU onsite. JH onsite. chief
- 805 Meet FDEP + Bud Connor of Geotek. Kerry Weiss of PBSC States no active drills will be going on in our sampling area today although staff will be in + out of area.
- Conduct H+S tailgate, review slopes + PFAS daily checklist.
- 835 Geotek, AD, AG + JU go to locate borings + mark utilities. JH + AD set up decontamination stations.
- 900 Claudia Edwards of PBSC brings copies of as-builts with utilities. Discuss staging location of IDW drums → they will identify a location for us.
- 915 K. Weiss identifies NW corner of training lot for IDW staging on asphalt - 2 to E-W rows of up to 25 drums.
- 925 Sample FQB-4 is collected off Hand angular prior to Sampling SB-12. Mobilize to SB-12. Refer to sample summary table.
- 1030 AD discusses boring + well locations with JU + Geotek. AD, AG + JH continue soil sampling.
- 1045 AD offsite.

Palm Beach State College

Project Name Palm Beach State College (PBSC)

Type of Work

Soil sampling

Project/Task Number FR3630B

Field Personnel

Andrew Gohm, JT Hollingshead, Josh Udayard

Date

2/5/20

Contractors

Time

Notes:

715

Andrew leaves home

745

Andrew arrives on site.

800

Safety/Kickoff meeting with Dennis and Bobby from FDEP and JT and Josh from Geosyntec

830

Andrew and JT set up for soil sampling.  
see soil logs for details.

1300

Andrew and JT finish soil sampling and JT demobilizes from site. Andrew starts GPS locating all boring/sampling locations.

1400

Andrew finishes GPS locating and demobilizes

1430

Andrew leaves site

~~Andrew leaves site~~

Project Name Palm Beach State College (PBSC)

Site Location	4200 S Congress Ave, Lake Worth	Project/Task Number	FR3630B
Type of Work	HTSA well installation	Date	2/6/20
Field Personnel	Joshua Uherdy, FDEP		
Contractors	PDS		

Time	Notes:
600	Mobilize to Site on light duty truck
700	Arrive at Site, PDS already onsite
705	Conduct tailgate safety, PDS begins descent of equipment
720	PDS begins staging soil drums from previous day
735	FDEP arrives onsite
800	PDS begins clearing DEPMW-2
808	PDS begins developing DEPMW-1, stops at 855
845	PDS completes installing DEPMW-6
929	FDEP develops DEPMW-5, stops at 955
930	PDS starts clearing DEPMW-4
1005	Stop work because of proximity to utility, wait for Amy Resantis to call back
1035	Amy calls, will move over 1 ft, FDEP checks in on well development others; see well installation log
1110	PDS completes installing DEPMW-4
1130	PDS begins to tend clear DEPMW-3
1230	PDS completes installing DEPMW-3
1245	FDEP demobilizes from site
1250	PDS starts developing DEPMW-2, stops at 1305
1330	PDS starts developing DEPMW-4, stops at 1400
1410	PDS starts developing DEPMW-8, stops at 1435

## Monitoring Well Installation

Date 2/24/2020

## Field Personnel

Grosvenor - J.J. Hollingshead (JH) & Josh Udvardy (JU)

## Contractors

~~Geofck, Erszébet~~ PDS

Geoprobe 8140LS

Time	Notes:
0830	JH, JU arrive at site (4200 S. Congress Ave., Lake Worth, FL); review scope of work, conduct tailgate safety meeting; Geotek conducts utility locate
0930-1015	trucks with drilling equipment arrive
1030	review scope of work, site layout, conduct tailgate safety meeting
1045	Cascade unloads equipment, constructs decom pit
1150	Geotek completes utility locate, exits site
1200-1315:	Cascade leaves site to pick up supplies
1315	continue unloading/setting up equipment
1400	begin decommissioning equipment
1450	begin advancing DEPMW-13 (hand auger)
1530	begin advancing DEPMW-13 (sonic); 100 ft core barrel; 100 ft 6-inch override casing; 75 ft 8-inch casing
1630	stop drilling; TD = 102 ft bbls, still in silty sand; agree to reevaluate tomorrow
1850	exit site
Note: FDEP arrives at 1555

Contractors

PDS

Time	Notes:
700	Mobilize to site in light duty truck
725	Arrive at site, FDFP + PDS onsite
745	Conduct tailgate safety, PDS continues and DEP MW-13.
830	Based on discussion w/ Eng. Seer and FDFP, will wait for more 4" piping for DEPMW-13 once ready currently note it advanced.
1000-45	Advance drill rod (4") to 108', will no longer wait for additional drill rod to advance further for DEPMW-13
1145	PDS has plug ~80', trying to clear out
1225	(8) Stop for lunch, PDS pushes sand back down to 105', will get gravel to put in bottom of borehole, JJ Hollingshead mobilizes to lime depot to get gravel
1310	JJ arrives back onsite w/ gravel, PDS begins setting DEPMW-13
1330	Extra rod for rig angles
1400	set bentonite, wait to hydrate/break for lunch (PDS)
1500	PDS arrives back onsite
1530	Finish checking if DEPMW-13 will re-hang (will), now to clean equipment, will purge DEPMW-13 tomorrow

Time	Notes:
605	Mobilize from home on light duty truck
710	Arrive at Site
730	FDEP, JJ Hollingshead, PDS on site
745	Conduct tailgate safety
750	Continue advancing at DEPMW-9
810	JJ Hollingshead checks DEPMW-13, water level at 4. <del>025</del> ft BTUC
835	Andrew Galvin arrives on site
840	PDS blows hose on rig
850	PDS calls tech company, will be at site around 10 to fix hoses
1000	Pirtle (hose repair) arrives
1045	Continue advancing DEPMW-9.
1105	Pause work to fix another hose
1110	PDS personnel with PFAS-free water (total of 7 liters) arrives
1120	Continue to advance DEPMW-9
1135	Andrew Galvin demobilizes from Site
1220	6" casing falls in borehole, PDS attempts to retrieve it, successful at 1250
1255	4" casing comes out of hole w/ 6" casing
1300	JJ H. talks to driller, 4" casing stuck in hole, have a problem, PDS will lift 6" to blow bore back down hole,

Contractors

PDS

Time	Notes:
700	Arrive at office, mobilize to site in light duty truck
730	Arrive at site, FDEP also onsite, PDS will be onsite around 8 after picking up a part
745	Call E Sager
805	PDS arrives onsite, call Eric Sager w/ Dennis from FDEP to discuss scope for rest of the week, will review more after progress on retrieving drill rods in DEPMW-10 borehole
820	Conduct fall/gale safety problems w/ drilling currently 60' of 4" drill rod stuck in hole, 4" rod stuck to 6" rod, rig itself is off-center; possible solution: PDS manufactured parts to prevent leaves will drill 8" casing to large hole open, try to center drill rig
907	Start developing DEPMW-13 (stop at 1003)
1010	Talk Eric Sager on phone to give update, PPS said it will take approximately 2-3 hrs to retrieve drill rods if everything goes correctly
1035	Updated: 80 ft of 8" casing advanced

Time	Notes:
1100	PDS personnel arrives with 4 totes of water
1115	Speak with Dennis and PDS about updated scope of work
1135	PDS retrieves 10' of 4" rods, threads are broken, 50' of 4-inch rod still in hole
1230	All 4" rods retrieved from borehole, PDS breaks for lunch
1400	PDS comes back onsite, continue advancing DEPMW-10
1520	Update: <del>off</del> 120' of 4" and 110' of 6" currently in borehole, with 90' of 8" drill rod
1630	4" rods advanced to 143' (did not advance to 150' in fear of possibly losing rod in hole), begin to pull core samples
1715	Speak w/ Eric Sager and FDEP (Dennis) on phone, no bedrock found, per FDEP well will be set at 165' (DEPMW-10)
1820	Call Eric Sager to give update well is sinking as drill rods are pulled up
1840	Call Amy DeSantis to give update
1855	Stop work, bentonite chips in borehole, well at 202'

**DAILY FIELD REPORT**

Project Name: PBSC  
 Project Number: PR 363013  
 Field Personnel: Andrew Golay (Geosyntec),  
Dennis and Mary (FDEM)  
 Recorded By: Andrew Golay  
 Weather: 70°F, Sunny

Date: 3/9/20 Page 1 of 1  
 Primary Activities: Groundwater Sampling (PFAS)

Time	Description of activities - location of work, work performed, equipment & personnel used, incidental information
720	Andrew Golay (AG) arrives on site
740	Dennis and Mary arrive on site
800	AG holds safety/turkoff meeting
820	AG begins depth to water measurements at wells on site. Depth to water measurements from TOC recorded below: DEPMW-7 → 4.03' TOC
	DEPMW-12 → 2.54' TOC
	DEPMW-9 → 2.76' TOC
	DEPMW-13 → 4.21' TOC
	DEPMW-6 → 4.37' TOC
	DEPMW-1 → 4.27' TOC
	DEPMW-8 → 5.24' TOC
	DEPMW-4 → 4.88' TOC
	DEPMW-10 → 2.39' TOC
	DEPMW-3 → 2.44' TOC
	DEPMW-11 → 2.60' TOC
	DEPMW-5 → 4.69' TOC
	DEPMW-2 → 3.09' TOC
1000	AG sets up on DEPMW-17, see purge form.
1030	AG calibrates YSI and calibration check's Turbidity meter, see calibration form
1210	AG sets up on DEPMW-9, see purge form
1335	AG sets up on DEPMW-13, see purge form
1445	AG sets up on DEPMW-10, see purge form
1535 AM	AG sets up on DEPMW-11, see purge form
1645	FDEM head off site. AG labels tanks and bolts down wells.
1740	AG conducts calibration check on YSI and turbidity meter, see cal form
1830	All personnel off site

Specific Conductance Probe Cleaned? Yes No

Dissolved Oxygen Membrane Changed? Yes No

1. See Table FS 2200-2 on the back of this form

CAL - Initial Calibration

ICV - Initial Calibration Verification

CCV - Continuing Calibration Verification

Allow adequate time for the dissolved oxygen sensor to equilibrate during air calibration

Calibrate specific conductance using at least two standards that bracket the range of expected sample readings (unless readings &lt;0.1 mS/cm is acceptable)

Calibrate pH using at least two standards (typ. pH 4 and 7) that bracket the range of expected sample readings; always start with pH 7; add a third calibration point if needed (i.e. pH &gt; 7)

If parameter fails to calibrate within SOP acceptance criteria then append sample results with a "J" qualifier

## Case Narrative

Unless otherwise noted, all samples included in this report were received in accordance with protocols referenced in Chapter 62-160, Florida Administrative Code (F.A.C.). Results published in this report pertain only to the samples as submitted to, and received by the laboratory. All times in this report are adjusted to the applicable Eastern Time Zone (EST or EDT).

Results for the following analytical groups are included in this report: Metals, Pesticides and Priority Organic Pollutants.

Scientific notation may be used in reporting very large or small values. Values reported using scientific notation will take the form of the following example: 1.3E+03, which is equivalent to  $1.3 \times 10^3$  or 1300.

Unless otherwise noted, analytical values for soil and sediment samples are reported on a dry weight basis, and analytical values for waste and tissue samples are reported on a wet weight basis.

Results for TNI accredited tests met requirements established by The NELAC Institute. A double asterisk (\*\*) is used to indicate an analyte/matrix/method for which the laboratory is not TNI accredited by the Florida Department of Health Environmental Laboratory Certification Program or where accreditation for that field of testing is not applicable.

Any significant anomalies or deviations from established protocols are documented in Non-Conformance Reports, which, where appropriate, are included within this analytical report. Additional comments related to specific analytical tests may be included as remarks following the analytical results for each sample. Such comments and remarks are for informational purposes only and are not intended to convey judgement about the usability of the reported data.

A quality control report on the performance of the test method for the submitted samples is included. Uncertainty associated with the analytical results contained in this report can be estimated from the reported quality assurance results and from published quality control acceptance limits for each analytical test. Matrix quality control results (matrix spike recoveries and matrix sample precision) pertain only to the matrix sample tested and do not necessarily reflect test method performance for other samples.

Typical matrix quality control (QC) measurements may include matrix spike recovery, matrix spike duplicate recovery, matrix spike precision and matrix sample precision. Not all matrix QC results may be available or reportable; where they are not an explanation is provided. Typical reasons for unavailable QC results include, but are not limited to, a) insufficient matrix sample to perform some or all QC measurements; b) analyte concentration in the sample replicated was too low for a meaningful measurement of precision and c) analyte concentration in the matrix sample spiked was too high (relative to the amount of analyte spiked) for a meaningful measurement of recovery. Where matrix QC results are unavailable, other method performance metrics (e.g., LCS recovery, LCS precision, surrogate recovery) may be used to assess performance of the method. Comments explaining any missing QC measurements are not intended to convey any adverse conclusions about the quality of the reported data.

Precision is reported as relative percent difference unless otherwise noted.

Quality Control codes as defined below may be used in this report to indicate results that are associated with one or more quality control elements which did not fall within established test method criteria. Such results may be qualified as estimates using a J qualifier as required by 62-160 F.A.C. Explanations are included in the report for any results that were reported as estimates for other reasons.

QC Codes used in this report may include:

LCS – Recovery for the batch Laboratory Control Sample (LCS) was outside existing control limits;  
MS – Recovery for the batch matrix spike (MS) was outside existing control limits;  
CCV – Recovery for a continuing calibration verification (CCV) standard was outside existing control limits;  
SUR – Recovery of a surrogate (SUR) for associated analytes was outside existing control limits;  
RPD – The precision, measured as relative percent difference (RPD), of batch replicate measurements was outside existing control limits;  
RSD – The precision, measured as relative standard deviation (RSD), of batch replicate measurements was outside existing control limits;  
SMP – Sample - used precision derived from replicate analyses of a sample;

The following data qualifiers are used, where applicable, in this report as specified in 62-160 F.A.C.

A - Value reported is the mean of two or more determinations.  
B - Results based on colony counts outside the acceptable range.  
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.  
J - Estimated value and/or the analysis did not meet established quality control criteria.  
K - Actual value is known to be less than value given.  
L - Actual value is known to be greater than value given.  
N - Presumptive evidence of presence of material.  
O - Sampled, but analysis lost or not performed.  
Q - Sample held beyond normal holding time.  
T - Value reported is less than the criterion of detection.  
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.  
V - Analyte was detected in both sample and method blank.  
X - Too few individuals to calculate SCI value.  
Y - The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.  
Z - Colonies were too numerous to count (TNTC).

Quality control information from overflow laboratories may not be included in this report. Please refer to the associated report from the overflow laboratory for additional information.

Ref. Method and Comment:

EPA 8270D: Matrix spike precision for some analytes is not available due to low analyte recoveries. MDLs are elevated due to matrix interference.  
Refer to the narrative for an explanation of QC Codes.

EPA 8321B: Insufficient sample to perform matrix spikes. MDL for some parameters elevated due to matrix interference.

EPA 8260D: The MDLs are elevated due to sample dilution as a result of excessive foaming.

## **Quality Assurance Report**

### **Precision**

\* Sample, spike and/or laboratory control sample precision (LCS) is reported.  
Replicate spike precision may be reported when sample results are below quantifiable levels.

## Case Narrative

Unless otherwise noted, all samples included in this report were received in accordance with protocols referenced in Chapter 62-160, Florida Administrative Code (F.A.C.). Results published in this report pertain only to the samples as submitted to, and received by the laboratory. All times in this report are adjusted to the applicable Eastern Time Zone (EST or EDT).

Results for the following analytical group are included in this report: Pesticides.

Scientific notation may be used in reporting very large or small values. Values reported using scientific notation will take the form of the following example: 1.3E+03, which is equivalent to  $1.3 \times 10^3$  or 1300.

Unless otherwise noted, analytical values for soil and sediment samples are reported on a dry weight basis, and analytical values for waste and tissue samples are reported on a wet weight basis.

Results for TNI accredited tests met requirements established by The NELAC Institute. A double asterisk (\*\*) is used to indicate an analyte/matrix/method for which the laboratory is not TNI accredited by the Florida Department of Health Environmental Laboratory Certification Program or where accreditation for that field of testing is not applicable.

Any significant anomalies or deviations from established protocols are documented in Non-Conformance Reports, which, where appropriate, are included within this analytical report. Additional comments related to specific analytical tests may be included as remarks following the analytical results for each sample. Such comments and remarks are for informational purposes only and are not intended to convey judgement about the usability of the reported data.

A quality control report on the performance of the test method for the submitted samples is included. Uncertainty associated with the analytical results contained in this report can be estimated from the reported quality assurance results and from published quality control acceptance limits for each analytical test. Matrix quality control results (matrix spike recoveries and matrix sample precision) pertain only to the matrix sample tested and do not necessarily reflect test method performance for other samples.

Typical matrix quality control (QC) measurements may include matrix spike recovery, matrix spike duplicate recovery, matrix spike precision and matrix sample precision. Not all matrix QC results may be available or reportable; where they are not an explanation is provided. Typical reasons for unavailable QC results include, but are not limited to, a) insufficient matrix sample to perform some or all QC measurements; b) analyte concentration in the sample replicated was too low for a meaningful measurement of precision and c) analyte concentration in the matrix sample spiked was too high (relative to the amount of analyte spiked) for a meaningful measurement of recovery. Where matrix QC results are unavailable, other method performance metrics (e.g., LCS recovery, LCS precision, surrogate recovery) may be used to assess performance of the method. Comments explaining any missing QC measurements are not intended to convey any adverse conclusions about the quality of the reported data.

Precision is reported as relative percent difference unless otherwise noted.

Quality Control codes as defined below may be used in this report to indicate results that are associated with one or more quality control elements which did not fall within established test method criteria. Such results may be qualified as estimates using a J qualifier as required by 62-160 F.A.C. Explanations are included in the report for any results that were reported as estimates for other reasons.

QC Codes used in this report may include:

- LCS – Recovery for the batch Laboratory Control Sample (LCS) was outside existing control limits;
- MS – Recovery for the batch matrix spike (MS) was outside existing control limits;
- CCV – Recovery for a continuing calibration verification (CCV) standard was outside existing control limits;
- SUR – Recovery of a surrogate (SUR) for associated analytes was outside existing control limits;
- RPD – The precision, measured as relative percent difference (RPD), of batch replicate measurements was outside existing control limits;
- RSD – The precision, measured as relative standard deviation (RSD), of batch replicate measurements was outside existing control limits;
- SMP – Sample - used precision derived from replicate analyses of a sample;

The following data qualifiers are used, where applicable, in this report as specified in 62-160 F.A.C.

- A - Value reported is the mean of two or more determinations.
- B - Results based on colony counts outside the acceptable range.
- I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
- J - Estimated value and/or the analysis did not meet established quality control criteria.
- K - Actual value is known to be less than value given.
- L - Actual value is known to be greater than value given.
- N - Presumptive evidence of presence of material.
- O - Sampled, but analysis lost or not performed.
- Q - Sample held beyond normal holding time.
- T - Value reported is less than the criterion of detection.
- U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
- V - Analyte was detected in both sample and method blank.
- X - Too few individuals to calculate SCI value.
- Y - The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.
- Z - Colonies were too numerous to count (TNTC).

Quality control information from overflow laboratories may not be included in this report. Please refer to the associated report from the overflow laboratory for additional information.

Perfluoroundecanoic acid (PFUnA)	98.9	108	P/P	60 - 160

\* Pass/Fail determinations are made for each bracketing calibration verification check.

Control limits for initial calibration checks may be different from those for continuing checks, depending on method requirements.  
Where they are different, both control limits are provided.

## Case Narrative

Unless otherwise noted, all samples included in this report were received in accordance with protocols referenced in Chapter 62-160, Florida Administrative Code (F.A.C.). Results published in this report pertain only to the samples as submitted to, and received by the laboratory. All times in this report are adjusted to the applicable Eastern Time Zone (EST or EDT).

Results for the following analytical groups are included in this report: Metals, Pesticides and Priority Organic Pollutants.

Scientific notation may be used in reporting very large or small values. Values reported using scientific notation will take the form of the following example: 1.3E+03, which is equivalent to  $1.3 \times 10^3$  or 1300.

Unless otherwise noted, analytical values for soil and sediment samples are reported on a dry weight basis, and analytical values for waste and tissue samples are reported on a wet weight basis.

Results for TNI accredited tests met requirements established by The NELAC Institute. A double asterisk (\*\*) is used to indicate an analyte/matrix/method for which the laboratory is not TNI accredited by the Florida Department of Health Environmental Laboratory Certification Program or where accreditation for that field of testing is not applicable.

Any significant anomalies or deviations from established protocols are documented in Non-Conformance Reports, which, where appropriate, are included within this analytical report. Additional comments related to specific analytical tests may be included as remarks following the analytical results for each sample. Such comments and remarks are for informational purposes only and are not intended to convey judgement about the usability of the reported data.

A quality control report on the performance of the test method for the submitted samples is included. Uncertainty associated with the analytical results contained in this report can be estimated from the reported quality assurance results and from published quality control acceptance limits for each analytical test. Matrix quality control results (matrix spike recoveries and matrix sample precision) pertain only to the matrix sample tested and do not necessarily reflect test method performance for other samples.

Typical matrix quality control (QC) measurements may include matrix spike recovery, matrix spike duplicate recovery, matrix spike precision and matrix sample precision. Not all matrix QC results may be available or reportable; where they are not an explanation is provided. Typical reasons for unavailable QC results include, but are not limited to, a) insufficient matrix sample to perform some or all QC measurements; b) analyte concentration in the sample replicated was too low for a meaningful measurement of precision and c) analyte concentration in the matrix sample spiked was too high (relative to the amount of analyte spiked) for a meaningful measurement of recovery. Where matrix QC results are unavailable, other method performance metrics (e.g., LCS recovery, LCS precision, surrogate recovery) may be used to assess performance of the method. Comments explaining any missing QC measurements are not intended to convey any adverse conclusions about the quality of the reported data.

Precision is reported as relative percent difference unless otherwise noted.

Quality Control codes as defined below may be used in this report to indicate results that are associated with one or more quality control elements which did not fall within established test method criteria. Such results may be qualified as estimates using a J qualifier as required by 62-160 F.A.C. Explanations are included in the report for any results that were reported as estimates for other reasons.

QC Codes used in this report may include:

LCS – Recovery for the batch Laboratory Control Sample (LCS) was outside existing control limits;  
MS – Recovery for the batch matrix spike (MS) was outside existing control limits;  
CCV – Recovery for a continuing calibration verification (CCV) standard was outside existing control limits;  
SUR – Recovery of a surrogate (SUR) for associated analytes was outside existing control limits;  
RPD – The precision, measured as relative percent difference (RPD), of batch replicate measurements was outside existing control limits;  
RSD – The precision, measured as relative standard deviation (RSD), of batch replicate measurements was outside existing control limits;  
SMP – Sample - used precision derived from replicate analyses of a sample;

The following data qualifiers are used, where applicable, in this report as specified in 62-160 F.A.C.

A - Value reported is the mean of two or more determinations.  
B - Results based on colony counts outside the acceptable range.  
I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.  
J - Estimated value and/or the analysis did not meet established quality control criteria.  
K - Actual value is known to be less than value given.  
L - Actual value is known to be greater than value given.  
N - Presumptive evidence of presence of material.  
O - Sampled, but analysis lost or not performed.  
Q - Sample held beyond normal holding time.  
T - Value reported is less than the criterion of detection.  
U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.  
V - Analyte was detected in both sample and method blank.  
X - Too few individuals to calculate SCI value.  
Y - The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.  
Z - Colonies were too numerous to count (TNTC).

Quality control information from overflow laboratories may not be included in this report. Please refer to the associated report from the overflow laboratory for additional information.

Ref. Method and Comment:

EPA 8270E: Precision for benzidine is not available due to no recoveries in the matrix spikes.

EPA 6020A: Batch matrix spike recoveries for barium are unavailable because of high analyte concentration in the QC sample.

EPA 8321B: Insufficient sample to perform matrix spikes. Refer to the Lab Analysis Report for an explanation of QC Codes.

EPA 8260D: Refer to the Lab Analysis Report for an explanation of QC Codes.

Batch ID: P380474

Component	% Rec.1	% Rec.2	Pass/Fail	Control Limits
Vinyl chloride	80.4	77.6	P/P	60 - 140

Reference Method: EPA 8270E

Batch ID: P380263

Component	% Rec.1	% Rec.2	Pass/Fail	Control Limits
1-Methylnaphthalene	114		P	50 - 130
1-Naphthylamine	26.9		P	20 - 130
1,2,4-Trichlorobenzene	122		P	50 - 130
1,2,4,5-Tetrachlorobenzene	124		P	50 - 130
1,3-Dinitrobenzene	122		P	50 - 130
1,3,5-Trinitrobenzene	104		P	50 - 150
2-Acetylaminofluorene	122		P	50 - 130
2-Chloronaphthalene	117		P	50 - 130
2-Chlorophenol	117		P	50 - 130
2-Methyl-4,6-dinitrophenol	133		P	50 - 150
2-Methylnaphthalene	113		P	50 - 130
2-Naphthylamine	23.2		P	20 - 130
2-Nitroaniline	111		P	50 - 130
2-Nitrophenol	105		P	50 - 130
2-Picoline	93.0		P	50 - 130
2,3,4,6-Tetrachlorophenol	122		P	50 - 130
2,4-Dichlorophenol	116		P	50 - 130
2,4-Dimethylphenol	108		P	50 - 119
2,4-Dinitrophenol	76.6		P	30 - 160
2,4-Dinitrotoluene	110		P	50 - 130
2,4,5-Trichlorophenol	95.7		P	50 - 130
2,4,6-Trichlorophenol	99.4		P	50 - 130
2,6-Dichlorophenol	126		P	50 - 130
2,6-Dinitrotoluene	124		P	50 - 130
3-Methylcholanthrene	122		P	50 - 130
3,3'-Dichlorobenzidine	90.4		P	20 - 200
4-Aminobiphenyl	118		P	30 - 130
4-Bromophenyl phenyl ether	128		P	50 - 130
4-Chloro-3-methylphenol	119		P	50 - 130
4-Chlorophenyl phenyl ether	119		P	50 - 130
4-Nitrophenol	82.6		P	15 - 110
5-Nitro-o-toluidine	97.0		P	50 - 130
7,12-Dimethylbenz(a)anthracene	129		P	50 - 130
Acenaphthene	119		P	50 - 130
Acenaphthylene	115		P	50 - 130
Acetophenone	122		P	50 - 130
Aniline	120		P	30 - 130
Anthracene	127		P	50 - 130
Azobenzene/1,2-Diphenylhydrazine	115		P	50 - 130
Benzidine	138		P	0.0 - 240
Benzo(a)anthracene	126		P	50 - 130
Benzo(a)pyrene	128		P	50 - 130
Benzo(b)fluoranthene	118		P	50 - 130
Benzo(g,h,i)perylene	128		P	50 - 130
Benzo(k)fluoranthene	125		P	50 - 130
Benzyl alcohol	104		P	50 - 130

## Quality Assurance Report Laboratory Control Sample Accuracy

Reference Method: EPA 8270E

Batch ID: P380263

Component	% Rec.1	% Rec.2	Pass/Fail	Control Limits
Bis(2-chloroethoxy)methane	118		P	50 - 130
Bis(2-chloroethyl)ether	120		P	50 - 160
Bis(2-chloroisopropyl)ether	88.7		P	50 - 130
Bis(2-ethylhexyl)phthalate	151		P	50 - 160
Butyl benzyl phthalate	140		P	50 - 160
Carbazole	116		P	50 - 130
Chrysene	127		P	50 - 130
Di-n-butyl phthalate	117		P	50 - 130
Di-n-octyl phthalate	126		P	50 - 130
Dibenzo(a,h)anthracene	125		P	50 - 130
Dibenzofuran	115		P	50 - 130
Diethyl phthalate	115		P	50 - 130
Dimethyl phthalate	122		P	50 - 130
Dimethylaminoazobenzene	127		P	50 - 130
Dinoseb	135		P	50 - 150
Ethyl methanesulfonate	121		P	50 - 130
Fluoranthene	126		P	50 - 130
Fluorene	108		P	50 - 130
Hexachlorobenzene	129		P	50 - 130
Hexachlorobutadiene	122		P	24 - 130
Hexachlorocyclopentadiene	116		P	20 - 130
Hexachloroethane	117		P	40 - 130
Hexachloropropene	118		P	50 - 130
Indeno(1,2,3-cd)pyrene	125		P	50 - 130
Isophorone	118		P	50 - 130
Iisosafrole	125		P	50 - 130
m,p-Cresols	85.9		P	50 - 130
N-Nitrosodi-n-butylamine	127		P	50 - 130
N-Nitrosodi-n-propylamine	112		P	50 - 130
N-Nitrosodiethylamine	122		P	50 - 130
N-Nitrosodimethylamine	61.2		P	30 - 130
N-Nitrosodiphenylamine/ Diphenylamine	154		P	50 - 160
N-Nitrosomethylethylamine	116		P	50 - 130
N-Nitrosomorpholine	107		P	50 - 150
N-Nitrosopiperidine	125		P	50 - 130
N-Nitrosopyrrolidine	121		P	50 - 130
Naphthalene	121		P	50 - 130
Nitrobenzene	112		P	50 - 130
o-Cresol	100		P	50 - 130
o-Toluidine	123		P	50 - 130
Pentachlorobenzene	123		P	50 - 130
Pentachloroethane	117		P	50 - 130
Pentachloronitrobenzene	129		P	50 - 130
Pentachlorophenol	120		P	50 - 130
Phenacetin	118		P	50 - 130
Phenanthrene	127		P	50 - 130
Phenol	63.7		P	15 - 110
Pyrene	121		P	50 - 130
Pyridine	66.8		P	20 - 130
Safrole	129		P	50 - 130

## Quality Assurance Report Laboratory Control Sample Accuracy

Reference Method: EPA 8321B

Batch ID: P380269

Component	% Rec.1	% Rec.2	Pass/Fail	Control Limits
4:2 Fluorotelomer sulfonate (4:2 FTS)	130	135	P/P	30 - 160
6:2 Fluorotelomer sulfonate (6:2 FTS)	113	150	P/P	30 - 160

## Case Narrative

Unless otherwise noted, all samples included in this report were received in accordance with protocols referenced in Chapter 62-160, Florida Administrative Code (F.A.C.). Results published in this report pertain only to the samples as submitted to, and received by the laboratory. All times in this report are adjusted to the applicable Eastern Time Zone (EST or EDT).

Results for the following analytical group are included in this report: Pesticides.

Scientific notation may be used in reporting very large or small values. Values reported using scientific notation will take the form of the following example: 1.3E+03, which is equivalent to  $1.3 \times 10^3$  or 1300.

Unless otherwise noted, analytical values for soil and sediment samples are reported on a dry weight basis, and analytical values for waste and tissue samples are reported on a wet weight basis.

Results for TNI accredited tests met requirements established by The NELAC Institute. A double asterisk (\*\*) is used to indicate an analyte/matrix/method for which the laboratory is not TNI accredited by the Florida Department of Health Environmental Laboratory Certification Program or where accreditation for that field of testing is not applicable.

Any significant anomalies or deviations from established protocols are documented in Non-Conformance Reports, which, where appropriate, are included within this analytical report. Additional comments related to specific analytical tests may be included as remarks following the analytical results for each sample. Such comments and remarks are for informational purposes only and are not intended to convey judgement about the usability of the reported data.

A quality control report on the performance of the test method for the submitted samples is included. Uncertainty associated with the analytical results contained in this report can be estimated from the reported quality assurance results and from published quality control acceptance limits for each analytical test. Matrix quality control results (matrix spike recoveries and matrix sample precision) pertain only to the matrix sample tested and do not necessarily reflect test method performance for other samples.

Typical matrix quality control (QC) measurements may include matrix spike recovery, matrix spike duplicate recovery, matrix spike precision and matrix sample precision. Not all matrix QC results may be available or reportable; where they are not an explanation is provided. Typical reasons for unavailable QC results include, but are not limited to, a) insufficient matrix sample to perform some or all QC measurements; b) analyte concentration in the sample replicated was too low for a meaningful measurement of precision and c) analyte concentration in the matrix sample spiked was too high (relative to the amount of analyte spiked) for a meaningful measurement of recovery. Where matrix QC results are unavailable, other method performance metrics (e.g., LCS recovery, LCS precision, surrogate recovery) may be used to assess performance of the method. Comments explaining any missing QC measurements are not intended to convey any adverse conclusions about the quality of the reported data.

Precision is reported as relative percent difference unless otherwise noted.

Quality Control codes as defined below may be used in this report to indicate results that are associated with one or more quality control elements which did not fall within established test method criteria. Such results may be qualified as estimates using a J qualifier as required by 62-160 F.A.C. Explanations are included in the report for any results that were reported as estimates for other reasons.

QC Codes used in this report may include:

- LCS – Recovery for the batch Laboratory Control Sample (LCS) was outside existing control limits;
- MS – Recovery for the batch matrix spike (MS) was outside existing control limits;
- CCV – Recovery for a continuing calibration verification (CCV) standard was outside existing control limits;
- SUR – Recovery of a surrogate (SUR) for associated analytes was outside existing control limits;
- RPD – The precision, measured as relative percent difference (RPD), of batch replicate measurements was outside existing control limits;
- RSD – The precision, measured as relative standard deviation (RSD), of batch replicate measurements was outside existing control limits;
- SMP – Sample - used precision derived from replicate analyses of a sample;

The following data qualifiers are used, where applicable, in this report as specified in 62-160 F.A.C.

- A - Value reported is the mean of two or more determinations.
- B - Results based on colony counts outside the acceptable range.
- I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
- J - Estimated value and/or the analysis did not meet established quality control criteria.
- K - Actual value is known to be less than value given.
- L - Actual value is known to be greater than value given.
- N - Presumptive evidence of presence of material.
- O - Sampled, but analysis lost or not performed.
- Q - Sample held beyond normal holding time.
- T - Value reported is less than the criterion of detection.
- U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
- V - Analyte was detected in both sample and method blank.
- X - Too few individuals to calculate SCI value.
- Y - The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.
- Z - Colonies were too numerous to count (TNTC).

Quality control information from overflow laboratories may not be included in this report. Please refer to the associated report from the overflow laboratory for additional information.

## Case Narrative

Unless otherwise noted, all samples included in this report were received in accordance with protocols referenced in Chapter 62-160, Florida Administrative Code (F.A.C.). Results published in this report pertain only to the samples as submitted to, and received by the laboratory. All times in this report are adjusted to the applicable Eastern Time Zone (EST or EDT).

Results for the following analytical groups are included in this report: Metals, Pesticides and Priority Organic Pollutants.

Scientific notation may be used in reporting very large or small values. Values reported using scientific notation will take the form of the following example: 1.3E+03, which is equivalent to  $1.3 \times 10^3$  or 1300.

Unless otherwise noted, analytical values for soil and sediment samples are reported on a dry weight basis, and analytical values for waste and tissue samples are reported on a wet weight basis.

Results for TNI accredited tests met requirements established by The NELAC Institute. A double asterisk (\*\*) is used to indicate an analyte/matrix/method for which the laboratory is not TNI accredited by the Florida Department of Health Environmental Laboratory Certification Program or where accreditation for that field of testing is not applicable.

Any significant anomalies or deviations from established protocols are documented in Non-Conformance Reports, which, where appropriate, are included within this analytical report. Additional comments related to specific analytical tests may be included as remarks following the analytical results for each sample. Such comments and remarks are for informational purposes only and are not intended to convey judgement about the usability of the reported data.

A quality control report on the performance of the test method for the submitted samples is included. Uncertainty associated with the analytical results contained in this report can be estimated from the reported quality assurance results and from published quality control acceptance limits for each analytical test. Matrix quality control results (matrix spike recoveries and matrix sample precision) pertain only to the matrix sample tested and do not necessarily reflect test method performance for other samples.

Typical matrix quality control (QC) measurements may include matrix spike recovery, matrix spike duplicate recovery, matrix spike precision and matrix sample precision. Not all matrix QC results may be available or reportable; where they are not an explanation is provided. Typical reasons for unavailable QC results include, but are not limited to, a) insufficient matrix sample to perform some or all QC measurements; b) analyte concentration in the sample replicated was too low for a meaningful measurement of precision and c) analyte concentration in the matrix sample spiked was too high (relative to the amount of analyte spiked) for a meaningful measurement of recovery. Where matrix QC results are unavailable, other method performance metrics (e.g., LCS recovery, LCS precision, surrogate recovery) may be used to assess performance of the method. Comments explaining any missing QC measurements are not intended to convey any adverse conclusions about the quality of the reported data.

Precision is reported as relative percent difference unless otherwise noted.

Quality Control codes as defined below may be used in this report to indicate results that are associated with one or more quality control elements which did not fall within established test method criteria. Such results may be qualified as estimates using a J qualifier as required by 62-160 F.A.C. Explanations are included in the report for any results that were reported as estimates for other reasons.

QC Codes used in this report may include:

- LCS – Recovery for the batch Laboratory Control Sample (LCS) was outside existing control limits;
- MS – Recovery for the batch matrix spike (MS) was outside existing control limits;
- CCV – Recovery for a continuing calibration verification (CCV) standard was outside existing control limits;
- SUR – Recovery of a surrogate (SUR) for associated analytes was outside existing control limits;
- RPD – The precision, measured as relative percent difference (RPD), of batch replicate measurements was outside existing control limits;
- RSD – The precision, measured as relative standard deviation (RSD), of batch replicate measurements was outside existing control limits;
- SMP – Sample - used precision derived from replicate analyses of a sample;

The following data qualifiers are used, where applicable, in this report as specified in 62-160 F.A.C.

- A - Value reported is the mean of two or more determinations.
- B - Results based on colony counts outside the acceptable range.
- I - The reported value is between the laboratory method detection limit and the laboratory practical quantitation limit.
- J - Estimated value and/or the analysis did not meet established quality control criteria.
- K - Actual value is known to be less than value given.
- L - Actual value is known to be greater than value given.
- N - Presumptive evidence of presence of material.
- O - Sampled, but analysis lost or not performed.
- Q - Sample held beyond normal holding time.
- T - Value reported is less than the criterion of detection.
- U - Material was analyzed for but not detected. The reported value is the method detection limit for the sample analyzed.
- V - Analyte was detected in both sample and method blank.
- X - Too few individuals to calculate SCI value.
- Y - The laboratory analysis was from an unpreserved or improperly preserved sample. The data may not be accurate.
- Z - Colonies were too numerous to count (TNTC).

Quality control information from overflow laboratories may not be included in this report. Please refer to the associated report from the overflow laboratory for additional information.

**Ref. Method and Comment:**

EPA 8270E: MDL for some analytes elevated due to matrix interference. Precision for benzidine is not available due to low recoveries in the duplicate matrix spikes. Refer to the Lab Analysis Report for an explanation of QC Codes.

EPA 8321B: MDLs are elevated due to matrix interference.

EPA 8260D: The MDLs are elevated due to required dilution of the sample matrix (foaming).

## Quality Assurance Report

### Calibration Verification

Reference Method: EPA 8321B

Run ID: A97642

Included Lab Sample IDs: 2155790

Component	% Rec.1	% Rec.2	Pass/Fail*	Control Limits
4:2 Fluorotelomer sulfonate (4:2 FTS)	89.5	96.3	P/P	60 - 160
6:2 Fluorotelomer sulfonate (6:2 FTS)	143	108	P/P	60 - 160
8:2 Fluorotelomer sulfonate (8:2 FTS)	108	109	P/P	60 - 160
Hexafluoropropylene oxide dimer acid	128	91.3	P/P	60 - 160
N-Et perfluoroctanesulfonamidoAc acid	104	98.2	P/P	60 - 160
N-Me perfluoroctanesulfonamidoAc acid	99.1	95.7	P/P	60 - 160
Perfluorobutanesulfonic acid (PFBS)	89.3	84.5	P/P	60 - 160
Perfluorodecanesulfonic acid (PFDS)	92.6	85.5	P/P	60 - 160
Perfluorodecanoic acid (PFDA)	98.7	83.6	P/P	60 - 160
Perfluorododecanoic acid (PFDoA)	106	72.7	P/P	60 - 160
Perfluoroheptanesulfonic acid (PFHpS)	78.5	75.6	P/P	60 - 160
Perfluoroheptanoic acid (PFHpA)	116	102	P/P	60 - 160
Perfluorohexanesulfonic acid (PFHxS)	140	121	P/P	60 - 160
Perfluorohexanoic acid (PFHxA)	91.6	90.6	P/P	60 - 160
Perfluorononanesulfonic acid (PFNS)	141	118	P/P	60 - 160
Perfluorononanoic acid (PFNA)	82.9	96.7	P/P	60 - 160
Perfluoroctanesulfonic acid (PFOS)	130	107	P/P	60 - 160
Perfluorooctanoic acid (PFOA)	85.7	99.4	P/P	60 - 160
Perfluoropentanesulfonic acid (PFPeS)	87.1	78.7	P/P	60 - 160
Perfluoropentanoic acid (PFPeA)	116	89.3	P/P	60 - 160
Perfluorotetradecanoic acid (PFTeA)	102	98.0	P/P	60 - 160
Perfluorotridecanoic acid (PFTriA)	104	81.1	P/P	60 - 160
Perfluoroundecanoic acid (PFUnA)	93.3	124	P/P	60 - 160

\* Pass/Fail determinations are made for each bracketing calibration verification check.

Control limits for initial calibration checks may be different from those for continuing checks, depending on method requirements.

Where they are different, both control limits are provided.
